0.1	Outline	1
0.2	Regular Points Are Open and Dense	3

0.1 Outline

- Prove Theorem 8.5.4
- Prove the continuation principle that was used in Proposition 8.1.4

Outline of statements:

Set up notation:

- $z = s + it$
- u is a solution to an equation (appearing below)
- X is a vector field (time-dependent and periodic) on \mathbb{R}^{2n}
- X, J are smooth
- $C(u)$ the set of critical points u

- $R(u)$ the set of regular points of u

Theorem 8.5.4: $C(u)$ is discrete and $R(u) \hookrightarrow \mathbb{R} \times S^1$ is open and dense.

Proposition 0.1(8.1.4,).

Define

$$\mathcal{Z}(x, y, J) := \{(u, H_0 + h) \mid h \in \mathcal{C}_\varepsilon^\infty(H_0) \text{ and } u \in \mathcal{M}(x, y, J, H)\}.$$

If $(u, H_0 + h) \in \mathcal{Z}(x, y)$ then the following map admits a continuous right-inverse and is surjective:

$$\begin{aligned} \Gamma : W^{1,p}(\mathbb{R} \times S^1; \mathbb{R}^{2n}) \times \mathcal{C}_\varepsilon^\infty(H_0) &\longrightarrow L^p(\mathbb{R} \times S^1; \mathbb{R}^{2n}) \\ (Y, h) &\longmapsto \left(d\mathcal{F}^{H_0+h}\right)_u(Y) + \text{grad}_u h \end{aligned}$$

Where \mathcal{F}^{H_0+h} is the Floer operator corresponding to H_+h .

Proposition 8.6.1 (Transform to CR-equation on \mathbb{R}^2) If u is a solution to the following equation:

$$\frac{\partial u}{\partial s} + J(t, u) \left(\frac{\partial u}{\partial t} - X(t, u) \right) = 0.$$

Then there exist

- An almost complex structure J
- A diffeomorphism ϕ on W ?
- A map $v \in C^\infty(\mathbb{R}^2; W)$

satisfying

$$\begin{cases} \frac{\partial v}{\partial s} + J \frac{\partial v}{\partial t} = 0 \\ v(s, t+1) = \phi(v(s, t)) \end{cases}$$

$$(s, t) \in \mathbb{R} \times [0, 1) \implies \begin{cases} C(u) = C(v) & \text{i.e. } u, v \text{ have the same critical points} \\ R(u) = R(v) \end{cases}.$$

Proof: short, include.

Lemma 8.6.2: The set of critical points of v above is discrete. Precisely: There exists a constant $\delta > 0$ such that $(dv)_z \neq 0$ for any $0 < |z| < \delta$.

Proof: Postponed to p.264.

Definition: Multiple points

Proposition 8.6.3: Injectivity result. Let v be a smooth 1-periodic (in t) solution of the CR equation, i.e. $v(s, t+1) = \phi(v(s, t))$ for some smooth ϕ ? and $\frac{\partial v}{\partial s} \neq 0$. Then $R(v) \hookrightarrow \mathbb{R}^2$ is open and dense.

0.2 Regular Points Are Open and Dense

Proof (BIG):

- Show $R(v)$ is open (easy)
- Show $R(v)$ is dense (delicate)

Long proof.

Lemma 8.6.4: For every $r > 0$ there exists a $\delta > 0$ such that

$$|t - t_0|, |s - s_0| < \delta \implies \exists s' \in B_r(s_j) \text{ s.t. } v(s, t) = v(s', t).$$

Proof: short.

Lemma 8.6.5: Let v_1, v_2 be two solutions of the CR-equation with $X_t \equiv 0$ on $B_\varepsilon(0)$, $v_1(0, 0) = v_2(0, 0)$ such that $(dv_1)_0, (dv_2)_0 \neq 0$. Also suppose

$$\forall \varepsilon \exists \delta \text{ s.t.}$$

$$\forall (s, t) \in B_\delta(0), \exists s' \in \mathbb{R} \left\{ \begin{array}{l} (s', t) \in B_\varepsilon(0) \\ v_1(s, t) = v_2(s', t) \end{array} \right. .$$

Then

$$\forall z \in B_\varepsilon(0), \quad v_1(s, t) = v_2(s, t).$$

Take perturbed CR equation:

$$\frac{\partial Y}{\partial s} + J_0 \frac{\partial Y}{\partial t} + S \cdot Y = 0.$$

Fix $S \in C^\infty(\mathbb{R}^2; \text{End}(\mathbb{R}^{2n}))$

Continuation Principle (8.6.6): Let Y be a solution to the perturbed CR equation on an open subset $U \subseteq \mathbb{R}^2$, then the set

$$C := \left\{ (s, t) \in U \mid Y \text{ has an infinite order zero at } (s, t) \right\}$$

is clopen. In particular, if U is connected and $Y = 0$ on some nonempty $V \subset U$, then $Y \equiv 0$.

Lemma (Similarity Principle, used to prove continuation principle and 8.6.8): Let $Y \in C^\infty(B_\varepsilon; \mathbb{C}^n)$ be a solution to the perturbed CR equation and let $p > 2$. Then there exists $0 < \delta < \varepsilon$ and a map $A \in W^{1,p}(B_\delta, \text{GL}(\mathbb{R}^{2n}))$ and a holomorphic map $\sigma : B_\delta \rightarrow \mathbb{C}^n$ such that

$$\forall (s, t) \in B_\delta \quad Y(s, t) = A(s, t) \sigma(s + it) \quad \text{and} \quad J_0 A(s, t) = A(s, t) J_0.$$

Use continuation principle to finish proofs of many old theorems/lemmas.

Theorem (8.6.11, Essential property of $\bar{\partial}$) For every $p > 1$, the following operator is surjective and Fredholm:

$$\bar{\partial} : W^{1,p}(S^2; \mathbb{C}^n) \longrightarrow L^p(\Lambda^{0,1} T^* S^2 \otimes \mathbb{C}^n).$$

Lead up to the proof of 8.1.5 in Section 8.7
