1 Problem 6

1.1 Part 1

Let $M = S^2$ as a smooth manifold, and consider a vector field on M ,

$$X : M \rightarrow TM$$

We want to show that there is a point $p \in M$ such that $X(p) = 0$.

Every vector field on a compact manifold without boundary is complete, and since S^2 is compact with $\partial S^2 = \emptyset$, X is complete.

Thus every integral curve of X exists for all time, yielding a well-defined flow

$$\phi : M \times \mathbb{R} \rightarrow M,$$

and thus a one-parameter family

$$\phi_t : M \rightarrow M \in \text{Diff}(M, M).$$

In particular, $\phi_0 = \text{id}_M$, and ϕ_1 is an arbitrary diffeomorphism of M , and moreover ϕ_0 is homotopic to ϕ_1 with homotopy given by

$$H : M \times I \rightarrow M(p, t) \mapsto \phi_t(p)$$
