### 1.1 Representability

Last time: Fix an  $S$ -scheme, i.e. a scheme over  $S$ .

Then there is a map

$$\begin{aligned} \mathrm{Sch}/S &\longrightarrow \mathrm{Fun}(\mathrm{Sch}/S^{\mathrm{op}}, \mathrm{Set}) \\ x &\mapsto h_x(T) = \mathrm{hom}_{\mathrm{Sch}/S}(T, x). \end{aligned}$$

where  $T' \xrightarrow{f} T$  is given by

$$\begin{aligned} h_x(f) : h_x(T) &\longrightarrow h_x(T') \\ (T \mapsto x) &\mapsto \text{triangles of the form} \end{aligned}$$

$$\begin{array}{ccc} T' & \xrightarrow{\quad} & X \\ & \searrow & \nearrow \\ & T & \end{array} .$$

**Theorem 1.1 (Yoneda).**

$$\mathrm{hom}_{\mathrm{Fun}}(h_x, F) = F(x).$$

**Corollary 1.2.**

$$\mathrm{hom}_{\mathrm{Sch}/S}(x, y) \cong \mathrm{hom}_{\mathrm{Fun}}(h_x, h_y).$$

**Definition 1.2.1** (Moduli Functor).

A **moduli functor** is a map

$$\begin{aligned} F : (\mathrm{Sch}/S)^{\mathrm{op}} &\longrightarrow \mathrm{Set} \\ F(x) &= \text{"Families of something over } x\text{"} \\ F(f) &= \text{"Pullback"}. \end{aligned}$$

**Definition 1.2.2** (Moduli Space).

A **moduli space** for that “something” appearing above is an  $M \in \mathrm{Obj}(\mathrm{Sch}/S)$  such that  $F \cong h_M$ .

Now fix  $S = \mathrm{Spec}(k)$ .

$h_m$  is the functor of points over  $M$ .

**Remark (1)**  $h_m(\mathrm{Spec}(k)) = M(\mathrm{Spec}(k)) \cong \text{“families over } \mathrm{Spec}(k)\text{”} = F(\mathrm{Spec}(k))$ .

**Remark (2)**  $h_M(M) \cong F(M)$  are families over  $M$ , and  $\mathrm{id}_M \in \mathrm{Mor}_{\mathrm{Sch}/S}(M, M) = \xi_{U_{\mathrm{niv}}}$  is the universal family.

Every family is uniquely the pullback of  $\xi_{U_{\mathrm{niv}}}$ . This makes it much like a classifying space.

For  $T \in \mathrm{Sch}/S$ ,

$$\begin{aligned} h_M &\xrightarrow{\cong} F \\ f \in h_M(T) &\xrightarrow{\cong} F(T) \ni \xi = F(f)(\xi_{U_{\mathrm{niv}}}). \end{aligned}$$

where  $T \xrightarrow{f} M$  and  $f = h_M(f)(\mathrm{id}_M)$ .

**Remark (3)** If  $M$  and  $M'$  both represent  $F$  then  $M \cong M'$  up to unique isomorphism.

$$\xi_M \qquad \qquad \xi_{M'}$$

$$M \xrightarrow{f} M'$$

$$M' \xrightarrow{g} M$$

$$\xi_{M'} \qquad \qquad \xi_M$$

which shows that  $f, g$  must be mutually inverse by using universal properties.

**Example 1.1.**

A length 2 subscheme of  $\mathbb{A}_k^1$  (??) then

$$F(S) = \{V(x^2 + bx + c)\} \subset \mathbb{A}'_5$$

where  $b, c \in \mathcal{O}_s(s)$ , which is functorially bijective with  $\{b, c \in \mathcal{O}_s(s)\}$  and  $F(f)$  is pullback.

Then  $F$  is representable by  $\mathbb{A}_k^2(b, c)$  and the universal object is given by

$$V(x^2 + bx + c) \subset \mathbb{A}^1(?) \times \mathbb{A}^2(b, c)$$

where  $b, c \in k[b, c]$ .

Moreover,  $F'(S)$  is the set of effective Cartier divisors in  $\mathbb{A}'_5$  which are length 2 for every geometric fiber.  $F''(S)$  is the set of subschemes of  $\mathbb{A}'_5$  which are length 2 on all geometric fibers. In both cases,  $F(f)$  is always given by pullback.

Problem:  $F''$  is not a good moduli functor, as it is not representable. Consider  $\text{Spec } k[\varepsilon]$ .

We think of  $T_p F''$  as the tangent space at  $p$ .

If  $F$  is representable, then it is actually the Zariski tangent space.

$$\begin{array}{ccc}
 M(\mathrm{Spec} \, k[\varepsilon]) & \longrightarrow & M(\mathrm{Spec} \, k) \\
 \uparrow \subset & & \uparrow \subset \\
 T_p M & \longrightarrow & p \\
 & & \uparrow \\
 & & \mathrm{Spec} \, k \\
 & \swarrow & \searrow ? \\
 \mathrm{Spec} \, k[\varepsilon] & \longrightarrow & \mathrm{Spec} \, \mathcal{O}_{M,p} \subset M
 \end{array}$$
  

$$\begin{array}{ccc}
 & & k \\
 & \nearrow & \uparrow \\
 \mathcal{O}_{M,p} & \longrightarrow & k[\varepsilon] \\
 \uparrow & & \uparrow \\
 \mathfrak{m}_p & & (\varepsilon) \\
 \uparrow & & \uparrow \\
 \mathfrak{m}_p^2 & & 0
 \end{array}$$

Moreover,  $T_p M = (\mathfrak{m}_p / \mathfrak{m}_p^2)^\vee$ , and in particular this is a  $k$ -vector space. To see the scaling structure, take  $\lambda \in k$ .

$$\begin{aligned}
 \lambda : k[\varepsilon] &\longrightarrow k[\varepsilon] \\
 \varepsilon &\mapsto \lambda \varepsilon
 \end{aligned}$$

$$\lambda^* : \mathrm{Spec} \, (k[\varepsilon]) \longrightarrow \mathrm{Spec} \, (k[\varepsilon])$$

$$\begin{aligned}
 \lambda : M(\mathrm{Spec} \, (k[\varepsilon])) &\longrightarrow M(\mathrm{Spec} \, (k[\varepsilon])) \\
 \cup & \qquad \cup \\
 T_p M &\longrightarrow T_p M.
 \end{aligned}$$

**Conclusion:** If  $F$  is representable, for each  $p \in F(\mathrm{Spec} \, k)$  there exists a unique point of  $T_p F$  that are invariant under scaling.

1. If  $F, F', G \in \mathrm{Fun}((\mathrm{Sch}/S)^{\mathrm{op}}, \mathrm{Set})$ , there exists a fiber product

$$\begin{array}{ccc}
F \times_G F' & \xrightarrow{\quad \quad \quad} & F' \\
\downarrow & & \downarrow \\
F & \xrightarrow{\quad \quad \quad} & G
\end{array}$$

where

$$(F \times_G F')(T) = F(T) \times_{G(T)} F'(T).$$

2. This works with the functor of points over a fiber product of schemes  $X \times_T Y$  for  $X, Y \rightarrow T$ , where

$$h_{X \times_T Y} = h_X \times_{h_t} h_Y.$$

3. If  $F, F', G$  are representable, then so is the fiber product  $F \times_G F'$ .  
4. For any functor

$$F : (\text{Sch}/S)^{\text{op}} \rightarrow \text{Set},$$

for any  $T \xrightarrow{f} S$  there is an induced functor

$$\begin{aligned}
F_T : (\text{Sch}/T) &\rightarrow \text{Set} \\
x &\mapsto F(x).
\end{aligned}$$

5.  $F$  is representable by  $M/S$  implies that  $F_T$  is representable by  $M_T = M \times_S T/T$ .

## 1.2 Projective Space

Consider  $\mathbb{P}_{\mathbb{Z}}^n$ , i.e. “rank 1 quotient of an  $n + 1$  dimensional free module”.

### Proposition 1.3.

$\mathbb{P}_{\mathbb{Z}}^n$  represents the following functor

$$\begin{aligned}
F : \text{Sch}^{\text{op}} &\rightarrow \text{Set} \\
F(S) &= \mathcal{O}_S^{n+1} \rightarrow L \rightarrow 0 / \sim.
\end{aligned}$$

where  $\sim$  identifies diagrams of the following form:

$$\begin{array}{ccccc}
\mathcal{O}_S^{n+1} & \longrightarrow & L & \longrightarrow & 0 \\
\parallel & & \downarrow \cong & & \\
\mathcal{O}_S^{n+1} & \longrightarrow & M & \longrightarrow & 0
\end{array}$$

and  $F(f)$  is given by pullbacks.

**Remark**  $\mathbb{P}_S^n$  represents the following functor:

$$F_S : (\text{Sch}/S)^{\text{op}} \longrightarrow \text{Set}$$

$$T \mapsto F_S(T) = \left\{ \mathcal{O}_T^{n+1} \longrightarrow L \longrightarrow 0 \right\} / \sim.$$

This gives us a cleaner way of gluing affine data into a scheme.

*Proof (of Proposition).*

Note:  $\mathcal{O}^{n+1} \longrightarrow L \longrightarrow 0$  is the same as giving  $n+1$  sections  $s_1, \dots, s_n$  of  $L$ , where surjectivity ensures that they are not the zero section.

So

$$F_i(S) = \left\{ \mathcal{O}_S^{n+1} \longrightarrow L \longrightarrow 0 \right\} / \sim,$$

with the additional condition that  $s_i \neq 0$  at any point.

There is a natural transformation  $F_i \longrightarrow F$  by forgetting the latter condition, and is in fact a subfunctor.

$F \leq G$  is a subfunctor iff  $F(s) \hookrightarrow G(s)$ .

**Claim:** It is enough to show that each  $F_i$  and each  $F_{ij}$  are representable, since we have natural transformations:

$$\begin{array}{ccc} F_i & \longrightarrow & F \\ \uparrow & & \uparrow \\ F_{ij} & \longrightarrow & F_j \end{array}$$

and each  $F_{ij} \longrightarrow F_i$  is an open embedding (on the level of their representing schemes).

**Example .**

For  $n = 1$ , we can glue along open subschemes

$$\begin{array}{ccc} & & F_0 \\ & \nearrow & \\ F_{01} & & \\ & \searrow & \\ & & F_1 \end{array}$$

For  $n = 2$ , we get overlaps of the following form:

This claim implies that we can glue together  $F_i$  to get a scheme  $M$ . We want to show that  $M$  represents  $F$ .  $F(s)$  (LHS) is equivalent to an open cover  $U_i$  of  $S$  and sections of  $F_i(U_i)$  satisfying the gluing (RHS).

Going from LHS to RHS isn't difficult, since for  $\mathcal{O}_S^{n+1} \rightarrow L \rightarrow 0$ ,  $U_i$  is the locus where  $s_i \neq 0$  and by surjectivity, this gives a cover of  $S$ .

RHS to LHS comes from gluing.

■

*Proof (of Claim).*

$$F_i(S) = \left\{ \mathcal{O}_S^{n+1} \rightarrow L \cong \mathcal{O}_S \rightarrow 0, s_i \neq 0 \right\},$$

but there are no conditions on the sections other than  $s_i$ .

So specifying  $F_i(S)$  is equivalent to specifying  $n - 1$  functions  $f_1 \cdots \widehat{f_i} \cdots f_n \in \mathcal{O}_S(s)$  with  $f_k \neq 0$ . We know this is representable by  $\mathbb{A}^n$ .

We also know  $F_{ij}$  is obviously the same set of sequences, where now  $s_j \neq 0$  as well, so we need to specify  $f_0 \cdots \widehat{f_i} \cdots \widehat{f_j} \cdots f_n$  with  $f_j \neq 0$ . This is representable by  $\mathbb{A}^{n-1} \times \mathbb{G}_m$ , i.e.  $\text{Spec } k[x_1, \dots, \widehat{x_i}, \dots, x_n, x_j^{-1}]$ . Moreover,  $F_{ij} \hookrightarrow F_i$  is open.

What is the compatibility we are using to glue? For any subset  $I \subset \{0, \dots, n\}$ , we can define

$$F_I = \left\{ \mathcal{O}_S^{n+1} \rightarrow L \rightarrow 0, s_i \neq 0 \text{ for } i \in I \right\} = \bigtimes_{i \in I} F_i,$$

and  $F_I \rightarrow F_J$  when  $I \supset J$ .

■

## 2 Tuesday January 14th

Last time: Representability of functors, and specifically projective space  $\mathbb{P}_{\mathbb{Z}}^n$  constructed via a functor of points, i.e.

$$h_{\mathbb{P}_{\mathbb{Z}}^n} : \mathbb{P}_{\mathbb{Z}}^n \text{Sch}^{\text{op}} \longrightarrow \text{Set}$$

$$s \mapsto \mathbb{P}_{\mathbb{Z}}^n(s) = \left\{ \mathcal{O}_s^{n+1} \longrightarrow L \longrightarrow 0 \right\}.$$

for  $L$  a line bundle, up to isomorphisms of diagrams:

$$\begin{array}{ccccc} \mathcal{O}_s^{n+1} & \longrightarrow & L & \longrightarrow & 0 \\ \Downarrow & & \downarrow \cong & & \\ \mathcal{O}_s^{n+1} & \longrightarrow & M & \longrightarrow & 0 \end{array}$$

That is, line bundles with  $n + 1$  sections that globally generate it, up to isomorphism.

The point was that for  $F_i \in \mathbb{P}_{\mathbb{Z}}^n$  where

$$F_i(s) = \left\{ \mathcal{O}_s^{n+1} \longrightarrow L \longrightarrow 0 \mid s_i \text{ is invertible} \right\}$$

are representable and can be glued together, and projective space represents this functor.

**Remark** Because projective space represents this functor, there is a universal object:

$$\begin{array}{ccccc} \mathcal{O}_{\mathbb{P}_{\mathbb{Z}}^n}^{n+1} & \longrightarrow & L & \longrightarrow & 0 \\ & & \Downarrow & & \\ & & \mathcal{O}_{\mathbb{P}_{\mathbb{Z}}^n}(1) & & \end{array}$$

and other functors are pullbacks of the universal one. (Moduli Space)

**Exercise** Show that  $\mathbb{P}_{\mathbb{Z}}^n$  is proper over  $\text{Spec } \mathbb{Z}$ . Use the evaluative criterion, i.e. there is a unique lift

$$\begin{array}{ccc} \text{Spec } k & \longrightarrow & \mathbb{P}_{\mathbb{Z}}^n \\ \downarrow & \nearrow \text{dashed} & \downarrow \\ \text{Spec } R & \longrightarrow & \text{Spec } \mathbb{Z} \end{array}$$

**Definition 2.0.1** (Equalizer).

For a category  $C$ , we say a diagram  $X \longrightarrow Y \rightrightarrows Z$  is an *equalizer* iff it is universal with respect to the property:

$$\begin{array}{ccccc} X & \longrightarrow & Y & \rightrightarrows & Z \\ & \nwarrow \text{dashed} & \uparrow & \nearrow & \\ & & S & & \end{array}$$

Note that  $X$  is the universal object here.

---

**Example 2.1.**

For sets,  $X = \{y \mid f(y) = g(y)\}$  for  $Y \xrightarrow{f,g} Z$ .

**Definition 2.0.2 (Coequalizer).**

A **coequalizer** is the dual notion,

**Example 2.2.**

Take  $C = \text{Sch}/S$ ,  $X/S$  a scheme, and  $X_\alpha \subset X$  an open cover. We can take two fiber products,  $X_{\alpha\beta}, X_{\beta\alpha}$ :

$$\begin{array}{ccc} X_\alpha & \longrightarrow & X \\ \uparrow & & \uparrow \\ X_{\alpha\beta} & \longrightarrow & X_\beta \end{array} \qquad \begin{array}{ccc} X_\beta & \longrightarrow & X \\ \uparrow & & \uparrow \\ X_{\beta\alpha} & \longrightarrow & X_\alpha \end{array}$$

These are canonically isomorphic.

In  $\text{Sch}/S$ , we have

$$\coprod_{\alpha\beta} X_{\alpha\beta} \xrightleftharpoons[g_{\alpha\beta}]{f_{\alpha\beta}} \coprod_{\alpha} X_{\alpha} \longrightarrow X$$

where

$$\begin{aligned} f_{\alpha\beta} &: X_{\alpha\beta} \longrightarrow X_\alpha \\ g_{\alpha\beta} &: X_{\alpha\beta} \longrightarrow X_\beta; \end{aligned}$$

this is a coequalizer.

Conversely, we can glue schemes. Given  $X_\alpha \longrightarrow X_{\alpha\beta}$  (schemes over open subschemes), we need to check triple intersections:

Then  $\varphi_{\alpha\beta} : X_{\alpha\beta} \xrightarrow{\cong} X_{\beta\alpha}$  must satisfy the **cocycle condition**:

1.

$$\varphi_{\alpha\beta}^{-1}(X_{\beta\alpha} \cap X_{\beta\gamma}) = X_{\alpha\beta} \cap X_{\alpha\gamma},$$

noting that the intersection is exactly the fiber product  $X_{\beta\alpha} \times_{X_\beta} X_{\beta\gamma}$ .

2. The following diagram commutes:

$$\begin{array}{ccc} X_{\alpha\beta} \cap X_{\alpha\gamma} & \xrightarrow{\varphi_{\alpha\gamma}} & X_{\gamma\alpha} \cap X_{\gamma\beta} \\ & \searrow \varphi_{\alpha\beta} & \nearrow \varphi_{\beta\gamma} \\ & X_{\beta\alpha} \cap X_{\beta\gamma} & \end{array}$$

Then there exists a scheme  $X/S$  such that  $\coprod_{\alpha\beta} X_{\alpha\beta} \rightrightarrows \coprod X_\alpha \rightarrow X$  is a coequalizer; this is the gluing.

Subfunctors satisfy a patching property because morphisms to schemes are locally determined. Thus representable functors (e.g. functors of points) have to be (Zariski) sheaves.

**Definition 2.0.3** (Zariski Sheaf).

A functor  $F : (\text{Sch}/S)^{\text{op}} \rightarrow \text{Set}$  is a *Zariski sheaf* iff for any scheme  $T/S$  and any open cover  $T_\alpha$ , the following is an equalizer:

$$F(T) \rightarrow \prod F(T_\alpha) \rightrightarrows \prod_{\alpha\beta} F(T_{\alpha\beta})$$

where the maps are given by restrictions.

**Example 2.3.**

Any representable functor is a Zariski sheaf precisely because the gluing is a coequalizer. Thus

if you take the cover

$$\coprod_{\alpha\beta} T_{\alpha\beta} \longrightarrow \coprod_{\alpha} T_{\alpha} \longrightarrow T,$$

since giving a local map to  $X$  that agrees on intersections is enough to specify a map from  $T \longrightarrow X$ .

Thus any functor represented by a scheme automatically satisfies the sheaf axioms.

**Definition 2.0.4** (Subfunctors, Open/Closed Functors).

Suppose we have a morphism  $F' \longrightarrow F$  in the category  $\text{Fun}(\text{Sch}/S, \text{Set})$ .

- This is a **subfunctor** if  $\iota(T)$  is injective for all  $T/S$ .
- $\iota$  is **open/closed/locally closed** iff for any scheme  $T/S$  and any section  $\xi \in F(T)$  over  $T$ , then there is an open/closed/locally closed set  $U \subset T$  such that for all maps of schemes  $T' \xrightarrow{f} T$ , we can take the pullback  $f^*\xi$  and  $f^*\xi \in F'(T')$  iff  $f$  factors through  $U$ .

I.e. we can test if pullbacks are contained in a subfunctors by checking factorization.

**Note** This is the same as asking if the subfunctor  $F'$ , which maps to  $F$  (noting a section is the same as a map to the functor of points), and since  $T \longrightarrow F$  and  $F' \longrightarrow F$ , we can form the fiber product  $F' \times_F T$ :

$$\begin{array}{ccc} F' & \longrightarrow & F \\ \uparrow & & \uparrow \xi \\ F' \times_F T & \xrightarrow{g} & T \end{array}$$

and  $F' \times_F T \cong U$ .

Note: this is almost tautological!

Thus  $F' \longrightarrow F$  is open/closed/locally closed iff  $F' \times_F T$  is representable and  $g$  is open/closed/locally closed.

I.e. base change is representable, and (?).

**Exercise (Tautologous)**

1. If  $F' \longrightarrow F$  is open/closed/locally closed and  $F$  is representable, then  $F'$  is representable as an open/closed/locally closed subscheme
2. If  $F$  is representable, then open/etc subschemes yield open/etc subfunctors

Mantra: Treat functors as spaces. We have a definition of open, so now we'll define coverings.

**Definition 2.0.5** (Open Covers).

A collection of open subfunctors  $F_{\alpha} \subset F$  is an **open cover** iff for any  $T/S$  and any section  $\xi \in F(T)$ , i.e.  $\xi : T \longrightarrow F$ , the  $T_{\alpha}$  in the following diagram are an open cover of  $T$ :

$$\begin{array}{ccc}
F_\alpha & \longrightarrow & F \\
\uparrow & & \uparrow \xi \\
T_\alpha & \longrightarrow & T
\end{array}$$

**Example 2.4.**

Given

$$F(s) = \{ \mathcal{O}_s^{n+1} \longrightarrow L \longrightarrow 0 \}$$

and  $F_i(s)$  given by those where  $s_i \neq 0$  everywhere, the  $F_i \longrightarrow F$  are an open cover. Because the sections generate everything, taking the  $T_i$  yields an open cover.

**Proposition 2.1.**

A Zariski sheaf  $F : (\text{Sch}/S)^{\text{op}} \longrightarrow \text{Set}$  with a representable open cover is representable.

*Proof.*

Let  $F_\alpha \subset F$  be an open cover, say each  $F_\alpha$  is representable by  $x_\alpha$ . Form the fiber product  $F_{\alpha\beta} = F_\alpha \times_F F_\beta$ . Then  $x_\beta$  yields a section (plus some openness condition?), so  $F_{\alpha\beta} = x_{\alpha\beta}$  representable. Because  $F_\alpha \subset F$ , the  $F_{\alpha\beta} \longrightarrow F_\alpha$  have the correct gluing maps.

This follows from Yoneda (schemes embed into functors), and we get maps  $x_{\alpha\beta} \longrightarrow x_\alpha$  satisfying the gluing conditions. Call the gluing scheme  $x$ ; we'll show that  $x$  represents  $F$ .

First produce a map  $x \longrightarrow F$  from the sheaf axioms. We have a map  $\xi \in \prod_{\alpha} F(x_\alpha)$ , and because we can pullback, we get a unique element  $\xi \in F(X)$  coming from the diagram

$$F(x) \longrightarrow \prod F(x_\alpha) \rightrightarrows \prod_{\alpha\beta} F(x_{\alpha\beta}).$$

■

**Lemma 2.2.**

If  $E \longrightarrow F$  is a map of functors and  $E, F$  are zariski sheaves, where there are open covers  $E_\alpha \longrightarrow E, F_\alpha \longrightarrow F$  with commutative diagrams

$$\begin{array}{ccc}
E & \longrightarrow & F \\
\uparrow & & \uparrow \\
E_\alpha & \xrightarrow{\cong} & F_\alpha
\end{array}$$

---

(i.e. these are isomorphisms locally) then the map is an isomorphism.

With the following diagram, we're done by the lemma:

$$\begin{array}{ccc} X & \longrightarrow & F \\ \uparrow & & \uparrow \\ X_\alpha & \xrightarrow{\cong} & F_\alpha \end{array}$$

**Example 2.5.**

For  $S$  and  $E$  a locally free coherent  $\mathcal{O}_S$  module,

$$\mathbb{P}E(T) = \{f^*E \longrightarrow L \longrightarrow 0\} / \sim$$

is a generalization of projectivization, then  $S$  admits a cover  $U_i$  trivializing  $E$ .

Then the restriction  $F_i \longrightarrow \mathbb{P}E$  where  $F_i(T)$  is the above set if  $f$  factors through  $U_i$  and empty otherwise. On  $U_i$ ,  $E \cong \mathcal{O}_{U_i}^{n_i}$ , so  $F_i$  is representable by  $\mathbb{P}_{U_i}^{n_i-1}$  by the proposition. (Note that this is clearly a sheaf.)

**Example 2.6.**

For  $E$  locally free over  $S$  of rank  $n$ , take  $r < n$  and consider the functor  $\text{Gr}(k, E)(T) = \{f^*E \longrightarrow Q \longrightarrow 0\} / \sim$  (a Grassmannian) where  $Q$  is locally free of rank  $k$ .

**Exercise**

- Show that this is representable
- For the Plucker embedding

$$\text{Gr}(k, E) \longrightarrow \mathbb{P} \wedge^k E,$$

a section over  $T$  is given by  $f^*E \longrightarrow Q \longrightarrow 0$  corresponding to

$$\wedge^k f^*E \longrightarrow \wedge^k Q \longrightarrow 0,$$

noting that the left-most term is  $f^* \wedge^k E$ .

Show that this is a closed subfunctor. (That it's a functor is clear, that it's closed is not.)

Take  $S = \text{Spec } k$ , then  $E$  is a  $k$ -vector space  $V$ , then sections of the Grassmannian are quotients of  $V \otimes \mathcal{O}$  that are free of rank  $n$ .

Take the subfunctor  $G_w \subset \text{Gr}(k, V)$  where

$$G_w(T) = \{\mathcal{O}_T \otimes V \longrightarrow Q \longrightarrow 0\} \text{ with } Q \cong \mathcal{O}_t \otimes W \subset \mathcal{O}_t \otimes V.$$

---

If we have a splitting  $V = W \oplus U$ , then  $G_W = \mathbb{A}(\text{hom}(U, W))$ . If you show it's closed, it follows that it's proper by the exercise at the beginning.

Thursday: Define the Hilbert functor, show it's representable. The Hilbert scheme functor gives e.g. for  $\mathbb{P}^n$  of all flat families of subschemes.

### 3 Thursday January 16th

#### 3.1 Subfunctors

A functor  $F' \subset F : (\text{Sch}/S)^{\text{op}} \rightarrow \text{Set}$  is **open** iff for all  $T \xrightarrow{\xi} F$  where  $T = h_T$  and  $\xi \in F(T)$ .

We can take fiber products:

$$\begin{array}{ccc}
 F' & \longrightarrow & F \\
 \uparrow & & \uparrow \\
 F' \times_F T & \xrightarrow{\text{Open}} & T \\
 \text{Representable} & & 
 \end{array}$$

So we can think of “inclusion in  $F$ ” as being an *open condition*: for all  $T/S$  and  $\xi \in F(T)$ , there exists an open  $U \subset T$  such that for all covers  $f : T' \rightarrow T$ , we have

$$F(f)(\xi) = f^*(\xi) \in F'(T')$$

iff  $f$  factors through  $U$ .

Suppose  $U \subset T$  in  $\text{Sch}/T$ , we then have

$$h_{U/T}(T') = \begin{cases} \emptyset & T' \rightarrow T \text{ doesn't factor} \\ \{\text{pt}\} & \text{otherwise} \end{cases}.$$

which follows because the literal statement is  $h_{U/T}(T') = \text{hom}_T(T', U)$ .

By the definition of the fiber product,

$$(F' \times_F T)(T') = \left\{ (a, b) \in F'(T) \times T(T) \mid \xi(b) = \iota(a) \text{ in } F(T) \right\},$$

where  $F' \xrightarrow{\iota} F$  and  $T \xrightarrow{\xi} F$ .

So note that the RHS diagram here is exactly given by pullbacks, since we identify sections of  $F/T'$  as sections of  $F$  over  $T/T'$  (?).

$$\begin{array}{ccc}
F' & \xrightarrow{\iota} & F \\
\uparrow & & \uparrow \xi \\
F' \times_F T & \longrightarrow & T
\end{array}
\quad
\begin{array}{c}
\swarrow f \circ \xi \\
T'
\end{array}$$

We can thus identify

$$(F' \times_F T)(T') = h_{U/S}(T'),$$

and so for  $U \subset T$  in  $\text{Sch}/S$  we have  $h_{U/S} \subset h_{T/S}$  is the functor of maps that factor through  $U$ . We just identify  $h_{U/S}(T') = \text{hom}_S(T', U)$  and  $h_{T/S}(T') = \text{hom}_S(T', T)$ .

**Example 3.1.**

$\mathbb{G}_m, \mathbb{G}_a$ .  $\mathbb{G}_a$  represents giving a global function,  $\mathbb{G}_m$  represents giving an invertible function.

$$\begin{array}{ccc}
\mathbb{G}_m & \longrightarrow & \mathbb{G}_a \\
\uparrow & & \uparrow f \in \mathcal{O}_T(T) \\
T' & \longrightarrow & T
\end{array}
\quad \text{L}$$

where  $T' = \{f \neq 0\}$  and  $\mathcal{O}_T(T)$  are global functions.

### 3.2 Actual Geometry: Hilbert Schemes

The best moduli space!

Want to parameterize families of subschemes over a fixed object. Fix  $k$  a field,  $X/k$  a scheme; we'll parameterize subschemes of  $X$ .

**Definition 3.0.1** (Hilbert Functor).

The hilbert functor is given by

$$\text{Hilb}_{X/S} : (\text{Sch}/S)^{op} \longrightarrow \text{Set}$$

which sends  $T$  to closed subschemes  $Z \subset X \times_S T \longrightarrow T$  which are flat over  $T$ .

Here flatness replaces the Cartier condition.

**Definition 3.0.2** (Flatness).

For  $X \xrightarrow{f} Y$  and  $\mathbb{F}$  a coherent sheaf on  $X$ ,  $f$  is flat over  $Y$  iff for all  $x \in X$  the stalk  $F_x$  is a flat

$\mathcal{O}_{y,f(x)}$ -module.

Note that  $f$  is flat if  $\mathcal{O}_x$  is.

Flatness corresponds to varying continuously.

**Warning:** Unless otherwise stated, assume schemes are Noetherian.

Note that everything works out if we only path with finite covers.

**Remark** If  $X/k$  is projective, so  $X \subset \mathbb{P}_k^n$ , we have line bundles  $\mathcal{O}_X(1) = \mathcal{O}(1)$ . For any sheaf  $F$  over  $X$ , there is a hilbert polynomial  $P_F(n) = \chi(F(n)) \in \mathbb{Z}[n]$ . ( i.e. we twist by  $\mathcal{O}(1)$   $n$  times.)

The cohomology of  $F$  isn't changed by the pushforward into  $\mathbb{P}_n$  since it's a closed embedding, i.e.

$$\chi(X, F) = \chi(\mathbb{P}^n, i_*F) = \sum (-1)^i \dim_k H^i(\mathbb{P}^n, i_*F(n)).$$

**Fact (First)** For  $n \gg 0$ ,  $\dim_k H^0 = \dim M_n$ , the  $n$ th graded piece of  $M$ , which is a graded module over the homogeneous coordinate ring whose  $i_*F = \tilde{M}$ .

In general, for  $L$  ample of  $X$  and  $F$  coherent on  $X$ , we can define a **Hilbert polynomial**,

$$P_F(n) = \chi(F \otimes L^n).$$

This is an invariant of a polarized projective variety, and in particular subschemes. Over irreducible bases, flatness corresponds to this invariant being constant.

**Proposition 3.1.**

For  $f : X \rightarrow S$  projective, i.e. there is a factorization:

$$\begin{array}{ccc} X & \hookrightarrow & \mathbb{P}^n \times S \ni \mathcal{O}(1) \\ & \searrow f & \swarrow \\ & S & \end{array}$$

If  $S$  is reduced, irreducible, locally Noetherian, then  $f$  is flat  $\iff P_{\mathcal{O}_{x_s}}$  is constant for all  $s \in S$ .

To be more precise, look the base change to  $X_1$ , and the pullback of the fiber?  $\mathcal{O} \Big|_{x_i} ?$

Note: not using the word “integral” here!  $S$  is flat  $\iff$  the hilbert polynomial over the fibers are constant.

**Example 3.2.**

The zero-dimensional subschemes  $Z \in \mathbb{P}_k^n$ , then  $P_Z$  is the length of  $Z$ , i.e.  $\dim_k(\mathcal{O}_Z)$ , and

$$P_Z(n) = \chi(\mathcal{O}_Z \otimes \mathcal{O}(n)) = \chi(\mathcal{O}_Z) = \dim_k H^0(Z; \mathcal{O}_Z) = \dim_k \mathcal{O}_Z(Z).$$

For two closed points in  $\mathbb{P}^2$ ,  $P_Z = 2$ .

Consider the affine chart  $\mathbb{A}^2 \subset \mathbb{P}^2$ , which is given by

$$\text{Spec } k[x, y]/(y, x^2) \cong k[x]/(x^2)$$

and  $P_Z = 2$ . I.e. in flat families, it has to record how the tangent directions come together.

**Example 3.3.**

Consider the flat family  $xy = 1$  (flat because it's an open embedding) over  $k[x]$ , here we have points running off to infinity.

**Proposition 3.2 (Modified Characterization of Flatness for Sheaves).**

A sheaf  $F$  is flat iff  $P_{F_S}$  is constant.

**3.2.1 Proof**

Assume  $S = \text{Spec } A$  for  $A$  a local Noetherian domain.

**Lemma 3.3.**

For  $F$  a coherent sheaf on  $X/A$  is flat, we can take the cohomology via global sections  $H^0(X; F(n))$ . This is an  $A$ -module, and is a free  $A$ -module for  $n \gg 0$ .

*Proof (of Lemma).*

Assumed  $X$  was projective, so just take  $X = \mathbb{P}_A^n$  and let  $F$  be the pushforward. There is a correspondence sending  $F$  to its ring of homogeneous sections constructed by taking the sheaf associated to the graded module  $\sum_{n \gg 0} H^0(\mathbb{P}_A^n; F(n))$ . This is equal to  $\oplus_{n \gg 0} H^0(\mathbb{P}_A^n; F(n))$  and taking the associated sheaf ( $Y \mapsto \tilde{Y}$ , as per Hartshorne's notation) which is free, and thus  $F$  is free.

See tilde construction in Hartshorne, essentially amounts to localizing free rings.

Conversely, take an affine cover  $U_i$  of  $X$ . We can compute the cohomology using Čech cohomology, i.e. taking the Čech resolution. We can also assume  $H^i(\mathbb{P}^m; F(n)) = 0$  for  $n \gg 0$ , and the Čech complex vanishes in high enough degree. But then there is an exact sequence

$$0 \longrightarrow H^0(\mathbb{P}^m; F(n)) \longrightarrow \mathcal{C}^0(\underline{U}; F(n)) \longrightarrow \cdots \longrightarrow \mathcal{C}^m(\underline{U}; F(n)) \longrightarrow 0.$$

Assuming  $F$  is flat, and using the fact that flatness is a 2 out of 3 property, the images of these maps are all flat by induction from the right.

Finally, local Noetherian + finitely generated flat implies free. ■

By the lemma, we want to show  $H^0(\mathbb{P}^m; F(n))$  is free for  $n \gg 0$  iff the hilbert polynomials on the fibers  $P_{F_S}$  are all constant.

**Claim 1** (1).

It suffices to show that for each point  $s \in \text{Spec } A$ , we have

$$H^0(X_s; F_S(n)) = H^0(X; F(n)) \otimes k(S)$$

for  $k(S)$  the residue field, for  $n \gg 0$ .

Note that  $P_{F_S}$  measures the rank of the LHS.

$\implies$  : The dimension of RHS is constant, whereas the LHS equals  $P_{F_S}(n)$ .

$\impliedby$  : If the dimension of the RHS is constant, so the LHS is free.

For a f.g. module over a local ring, testing if localization at closed point and generic point have the same rank.

For  $M$  a finitely generated module over  $A$ , find  $0 \longrightarrow A^n \longrightarrow M \longrightarrow Q$  is surjective after tensoring with  $\text{Frac}(A)$ , and tensoring with  $k(S)$  for a closed point, if  $\dim A^n = \dim M$  then  $Q = 0$ .

*Proof (of Claim 1).*

By localizing, we can assume  $s$  is a closed point. Since  $A$  is Noetherian, its ideal is f.g. and we have

$$A^m \longrightarrow A \longrightarrow k(S) \longrightarrow 0.$$

We can tensor with  $F$  (viewed as restricting to fiber) to obtain

$$F(n)^m \longrightarrow F(n) \longrightarrow F_S(n) \longrightarrow 0.$$

Because  $F$  is flat, this is still exact.

We can take  $H^*(x, \cdot)$ , and for  $n \gg 0$  only  $H^0$  survives. This is the same as tensoring with  $H^0(x, F(n))$ . ■

**Definition 3.3.1** (Hilbert Polynomial Subfunctor).

Given a polynomial  $P \in \mathbb{Z}[n]$  for  $X/S$  projective, we define a subfunctor by picking only those with Hilbert polynomial  $p$  fiberwise as  $\text{Hilb}_{X/S}^P \subset \text{Hilb}_{X/S}$ . This is given by  $Z \subset X \times_S T$  with  $P_Z = P$ .

**Theorem 3.4** (*Grothendieck*).

If  $S$  is Noetherian and  $X/S$  projective, then  $\text{Hilb}_{X/S}^P$  is representable by a projective  $S$ -scheme.

See cycle spaces in analytic geometry.

---

## 4 Thursday January 23

Some facts about the Hilbert polynomial:

1. For a subscheme  $Z \subset \mathbb{P}_k^n$  with  $\deg Z = \dim Z = n$ , then

$$p_Z(t) = \deg Z t^n / (n!) + O(t^{n-1}).$$

2. We have  $p_Z(t) = \chi(\mathcal{O}_Z(t))$ , consider the sequence

$$0 \longrightarrow I_Z(t) \longrightarrow \mathcal{O}_{\mathbb{P}^n}^{(t)} \longrightarrow \mathcal{O}_Z^{(t)} \longrightarrow 0,$$

then  $\chi(I_Z(t)) = \dim H^0(\mathbb{P}^n, J_Z(t))$  for  $t \gg 0$ , and  $p_Z(0)$  is the Euler characteristic of  $\mathcal{O}_Z$ .

Serre vanishing, Riemann-Roch, ideal sheaf.

**Example 4.1** (Good to keep in mind).

The twisted cubic:

Then

$$p_C(t) = (\deg C)t + \chi(\mathcal{O}_{\mathbb{P}^1}) = 3t + 1.$$

### 4.0.1 Hypersurfaces

Recall that length 2 subschemes of  $\mathbb{P}^1$  are the same as specifying quadratics that cut them out, each such  $Z \subset \mathbb{P}^1$  satisfies  $Z = V(f)$  where  $\deg f = d$  and  $f$  is homogeneous. So we'll be looking at  $\mathbb{P}H^0(\mathbb{P}_k^n, \mathcal{O}(d))^\vee$ , and the guess would be that this is  $\text{Hilb}_{\mathbb{P}_k^n}$

Resolve the structure sheaf

---

$$0 \longrightarrow \mathcal{O}_{\mathbb{P}^n}(-d) \longrightarrow \mathcal{O}_{\mathbb{P}^n}(t) \longrightarrow \mathcal{O}_D(t) \longrightarrow 0.$$

so we can twist to obtain

$$0 \longrightarrow \mathcal{O}_{\mathbb{P}^n}(t-d) \longrightarrow \mathcal{O}_{\mathbb{P}^n}(t) \longrightarrow \mathcal{O}_D(t) \longrightarrow 0.$$

Then

$$\chi(\mathcal{O}_D(t)) = \chi(\mathcal{O}_{\mathbb{P}^n}(t)) - \chi(\mathcal{O}_{\mathbb{P}^n}(t-d)),$$

which is

$$\binom{n+t}{n} - \binom{n+t-d}{n} = d \frac{t^{n-1}}{(n-1)!} + O(t^{n-2}).$$

**Lemma 4.1.**

Anything with the Hilbert polynomial of a degree  $d$  hypersurface is in fact a degree  $d$  hypersurface.

Want to write a morphism of functors

$$\mathrm{Hilb}_{\mathbb{P}_k^n}^{P_{n,d}} \longrightarrow \mathbb{P}H^0(\mathbb{P}^n, \mathcal{O}(d))^\vee.$$

which sends flat families to families of equations cutting them out.

Want  $Z \subset \mathbb{P}^n \times S \longrightarrow \mathcal{O}_s \otimes H^0(\mathbb{P}^n, \mathcal{O}(d))^\vee \longrightarrow L \longrightarrow 0$ . This happens iff  $0 \longrightarrow L^\vee \longrightarrow \mathcal{O}_s \otimes H^0(\mathbb{P}^n, \mathcal{O}(d))$  with torsion-free quotient. Note that we use  $L^\vee$  instead of  $\mathcal{O}_s$  because of scaling.

We have

$$\begin{aligned} 0 &\longrightarrow I_z \longrightarrow \mathcal{O}_{\mathbb{P}^n \times S} \longrightarrow \mathcal{O}_z \longrightarrow 0 \\ 0 &\longrightarrow I_z(d) \longrightarrow \mathcal{O}_{\mathbb{P}^n \times S}(d) \longrightarrow \mathcal{O}_z(d) \longrightarrow 0 \quad \text{by twisting.} \end{aligned}$$

We then consider  $\pi_s : \mathbb{P}^n \times S \longrightarrow S$ , and apply the pushforward to the above sequence noting that it is not right-exact.

$$\begin{aligned} 0 &\longrightarrow \pi_{s*} I_z(d) \longrightarrow \pi_{s*} \mathcal{O}_{\mathbb{P}^n \times S}(d) \longrightarrow \pi_{s*} \mathcal{O}_z(d) \longrightarrow 0 \\ &= 0 \longrightarrow L^\vee = \mathcal{O}_s \otimes H^0(\mathbb{P}^n, \mathcal{O}(d)) \longrightarrow \text{locally free.} \end{aligned}$$

---

This equality follows from flatness, cohomology, and base change. In particular, we need the following facts

The scheme-theoretic fibers, given by  $H^0(\mathbb{P}^n, I_z(d))$  and  $H^0(\mathbb{P}^n, \mathcal{O}_z(d))$ , are all the same dimension.

Using

1. Cohomology and base change, i.e. for  $X \xrightarrow{f} Y$  a map of Noetherian schemes (or just finite-type) and  $F$  a sheaf on  $X$  which is flat over  $Y$ , there is a natural map (not usually an isomorphism)  $R^i f_* f \otimes k(y) \rightarrow H^i(x_y, F|_{x_y})$ , but is an isomorphism if  $\dim H^i(x_y, F|_{x_y})$  is constant, in which case  $R^i f_* f$  is locally free.
2. If  $Z \subset \mathbb{P}_k^n$  is a degree  $d$  hypersurface, then independently we know  $\dim H^0(\mathbb{P}^n, I_z(d)) = 1$  and  $\dim H^0(\mathbb{P}^n, \mathcal{O}_z(d)) = \binom{d+n}{n} - 1$ .

To get a map going backwards, we take the universal degree 2 polynomial and form  $V(a_{00}x_0^2 + a_{11}x_1^2 + a_{12}x_2^2 + a_{01}x_0x_1 + a_{02}x_0x_2 + a_{12}x_1x_2) \subset \mathbb{P}^2 \times \mathbb{P}^5$ .

Next example: twisted cubics.

Consider a map  $\mathbb{P}^1 \rightarrow \mathbb{P}^3$  obtained by taking a basis of a homogeneous cubic polynomial. The canonical example is  $(x, y) \rightarrow (x^3, x^2y, xy^2, y^3)$ . Then  $P_C(t) = 3t+1$ , and  $\text{Hilb}_{\mathbb{P}_k^3}^{3t+1}$  has a component with generic point a twisted cubic, and another component with points a curve disjoint union a point, and the overlap are nodal curves with a “fat” 3-dimensional point:

Then  $P_{C'} = 1 + \tilde{P}$ , the hilbert polynomial of just the base without the disjoint point, so this equals  $1 + P_{2,3} = 1 + (3t+0) = 3t+1$ . For  $P_{C''}$ , we take the sequence  $0 \rightarrow k \rightarrow \mathcal{O}_{C''} \rightarrow \mathcal{O}_{C''\text{reduced}} \rightarrow 0$ , so  $P_{C''} = 1 + P_{C''\text{red}} = 3t+1$ .

Note: flat families have to have the same constant Hilbert polynomial.

Note that we can get paths in this space from  $C \rightarrow C''$  and  $C' \rightarrow C''$  by collapsing a twisted cubic onto a plane, and sending a disjoint point crashing into the node on a nodal cubic.

We're mapping  $\mathbb{P}^1 \rightarrow \mathbb{P}^3$ , and there is a natural action of  $\mathbb{P}\text{GL}(4) \curvearrowright \mathbb{P}^3$ , so we get a map

$$\mathbb{P}\text{GL}(4) \times \mathbb{P}^3 \rightarrow \mathbb{P}^3.$$

Let  $c \in \mathbb{P}^3$  and let  $\mathcal{C}$  be the preimage. This induces (?) a map  $\mathbb{P}\text{GL}(4) \rightarrow \text{Hilb}_{\mathbb{P}^3}^{3t+1}$  where the fiber over  $[C]$  in the latter is  $\mathbb{P}\text{GL}(2) = \text{Aut}(\mathbb{P}^1)$ . By dimension counting, we find that the dimension of

---

the twisted cubic component is  $15 - 3 = 12$ .

The 15 in the other component comes from 3-dim choices of plane, 3-dim choices of a disjoint point, and  $\mathbb{P}H^0(\mathbb{P}^2, \mathcal{O}(3))^\vee \cong \mathbb{P}^9$ , yielding 15 dimensions.

To show that these are actually different components, we use Zariski tangent spaces. Let  $T_1$  be the tangent space of the twisted cubic component, then  $\dim T_1 \text{Hilb}_{\mathbb{P}_k^3}^{3t+1} = 12$ , and similarly the dimension of the tangent space over the  $C'$  component is 15.

Algebra fact: Let  $A$  be Noetherian and local, then the dimension of the Zariski tangent space,  $\dim \mathfrak{m}/\mathfrak{m}^2 \geq \dim A$ , the Krull dimension. If this is an equality, then  $A$  is regular.

Thus dimensions of the tangent spaces give an upper bound.

Proposition: If  $X/k$  is projective and  $P$  is a Hilbert polynomial, then  $[Z] \in \text{Hilb}_{X/k}^P$ , i.e. a closed subscheme of  $X$  with hilbert polynomial  $p$  (note there's an ample bundle floating around) then the tangent space is  $\text{hom}_{\mathcal{O}_x}(I_z, \mathcal{O}_z)$ .
