1 Problem 1

1.1 Part a

We want to show that $\ell^2(\mathbb{N})$ is complete, so let $\{x_n\} \subseteq \ell^2(\mathbb{N})$ be a Cauchy sequence, so $\|x^j - x^k\|_{\ell^2} \rightarrow 0$. We want to produce some $\mathbf{x} := \lim_{n \rightarrow \infty} x^n$ such that $x \in \ell^2$.

To this end, for each fixed index i , define

$$\mathbf{x}_i := \lim_{n \rightarrow \infty} x_i^n.$$

This is well-defined since $\|x^j - x^k\|_{\ell^2} = \sum_i |x_i^j - x_i^k|^2 \rightarrow 0$, and since this is a sum of positive real numbers that approaches zero, each term must approach zero. But then for a fixed i , the sequence $|x_i^j - x_i^k|^2$ is a Cauchy sequence of real numbers which necessarily converges in \mathbb{R} .

We also have $\|\mathbf{x} - x^j\|_{\ell^2} \rightarrow 0$ since

$$\|\mathbf{x} - x^j\|_{\ell^2} = \left\| \lim_{k \rightarrow \infty} x^k - x^j \right\|_{\ell^2} = \lim_{k \rightarrow \infty} \|x^k - x^j\|_{\ell^2} \rightarrow 0$$

where the limit can be passed through the norm because the map $t \mapsto \|t\|_{\ell^2}$ is continuous. So $x^j \rightarrow \mathbf{x}$ in ℓ^2 as well.

It remains to show that $\mathbf{x} \in \ell^2(\mathbb{N})$, i.e. that $\sum_i |\mathbf{x}_i|^2 < \infty$. To this end, we write

$$\begin{aligned}\|\mathbf{x}\|_{\ell^2} &= \|\mathbf{x} - x^j + x^j\|_{\ell^2} \\ &\leq \|\mathbf{x} - x^j\|_{\ell^2} + \|x^j\|_{\ell^2} \\ &\rightarrow M < \infty,\end{aligned}$$

where $\|\mathbf{x}_i - x^j\|_{\ell^2} \rightarrow 0$ and the second sum is finite because $x^j \in \ell^2 \iff \|x^j\|_{\ell^2} := M < \infty$. \square

1.2 Part b

Let H be a Hilbert space with inner product $\langle \cdot, \cdot \rangle$ and induced norm $\|\cdot\|$.

Lemma: For any complex number z , we have

$$\Im(z) = \Re(-iz),$$

and as a corollary, we have

$$\Re(\langle x, iy \rangle) = \Re(-i\langle x, y \rangle) = \Im(\langle x, y \rangle).$$

We can compute the following:

$$\|x + y\|^2 = \|x\|^2 + \|y\|^2 + 2 \Re(\langle x, y \rangle)$$

$$\|x - y\|^2 = \|x\|^2 + \|y\|^2 - 2 \Re(\langle x, y \rangle)$$

$$\begin{aligned}\|x + iy\|^2 &= \|x\|^2 + \|y\|^2 + 2 \Re(\langle x, iy \rangle) \\ &= \|x\|^2 + \|y\|^2 + \Im(\langle x, y \rangle)\end{aligned}$$

$$\begin{aligned}\|x - iy\|^2 &= \|x\|^2 + \|y\|^2 - 2 \Re(\langle x, iy \rangle) \\ &= \|x\|^2 + \|y\|^2 + \Im(\langle x, y \rangle)\end{aligned}$$

and summing these all

$$\begin{aligned}\|x + y\|^2 - \|x - y\|^2 + i\|x + iy\|^2 - i\|x - iy\|^2 &= 4 \Re(\langle x, y \rangle) + 4i \Im(\langle x, y \rangle) \\ &= 4\langle x, y \rangle.\end{aligned}$$

To conclude that a linear map U is an isometry iff U is unitary, if we assume U is unitary then we can write

$$\|x\|^2 := \langle x, x \rangle = \langle Ux, Ux \rangle := \|Ux\|^2.$$

Assuming now that U is an isometry, by the polarization identity we can write

$$\begin{aligned} \langle Ux, Uy \rangle &= \frac{1}{4} \left(\|Ux + Uy\|^2 + \|Ux - Uy\|^2 + i\|Ux + Uy\|^2 - i\|Ux - Uy\|^2 \right) \\ &= \frac{1}{4} \left(\|U(x + y)\|^2 + \|U(x - y)\|^2 + i\|U(x + y)\|^2 - i\|U(x - y)\|^2 \right) \\ &= \frac{1}{4} \left(\|x + y\|^2 + \|x - y\|^2 + i\|x + y\|^2 - i\|x - y\|^2 \right) \\ &= \langle x, y \rangle. \end{aligned}$$

□

2 Problem 2

Lemma: The map $\langle \cdot, \cdot \rangle : H \times H \rightarrow \mathbb{R}$ is continuous.

Proof:

Let $x_n \rightarrow x$ and $y_n \rightarrow y$, then

$$\begin{aligned} |\langle x_n, y_n \rangle - \langle x, y \rangle| &= |\langle x_n, y_n \rangle - \langle x, y_n \rangle + \langle x, y_n \rangle - \langle x, y \rangle| \\ &= |\langle x_n - x, y_n \rangle + \langle x, y_n - y \rangle| \\ &\leq \|x_n - x\| \|y_n\| + \|x\| \|y_n - y\| \\ &\rightarrow 0 \cdot M + C \cdot 0 < \infty, \end{aligned}$$

where $\|y_n\| \rightarrow M$ since $y_n \rightarrow y$ implies that $\|y_n\|$ is bounded.

2.1 Part a:

Using the lemma, letting $\{e_n\}$ be a sequence in E^\perp , so $y \in E \implies \langle e_n, y \rangle = 0$. Since H is complete, $e_n \rightarrow e \in H$; we can show that $e \in E^\perp$ by letting $y \in E$ be arbitrary and computing

$$\langle e, y \rangle = \left\langle \lim_n e_n, y \right\rangle = \lim_n \langle e_n, y \rangle = \lim_n 0 = 0,$$

so $e \in E^\perp$.

2.2 Part b:

Let $S := \text{span}_H(E)$; then the smallest closed subspace containing E is \overline{S} , the closure of S . We will proceed by showing that $E^{\perp\perp} = \overline{S}$.

$\overline{S} \subseteq E^{\perp\perp}$:

Let $\{x_n\}$ be a sequence in S , so $x_n \rightarrow x \in \overline{S}$.

First, each x_n is in $E^{\perp\perp}$, since if we write $x_n = \sum a_i e_i$ where $e_i \in E$, we have

$$y \in E^\perp \implies \langle x_n, y \rangle = \left\langle \sum_i a_i e_i, y \right\rangle = \sum_i a_i \langle e_i, y \rangle = 0 \implies x_n \in (E^\perp)^\perp.$$

It remains to show that $x \in E^{\perp\perp}$, which follows from

$$y \in E^\perp \implies \langle x, y \rangle = \left\langle \lim_n x_n, y \right\rangle = \lim_n \langle x_n, y \rangle = 0 \implies x \in (E^\perp)^\perp,$$

where we've used continuity of the inner product.

$E^{\perp\perp} \subseteq \overline{S}$:

For notation convenience, we'll just write S for \overline{S} . Let $x \in E^{\perp\perp}$. Noting that S is closed, we can define P , the operator projecting elements onto S , and write

$$x = Px + (x - Px) \in S \oplus S^\perp$$

But since $\langle x, x - Px \rangle = 0$ because $x - Px \in E^\perp$ and $x \in (E^\perp)^\perp$, we can rewrite the first term in this inner product to obtain

$$0 = \langle x, x - Px \rangle = \langle Px + (x - Px), x - Px \rangle = \langle Px, x - Px \rangle + \langle x - Px, x - Px \rangle,$$

where we can note that the first term is zero because $Px \in S$ and $x - Px \in S^\perp$, and the second term is $\|x - Px\|^2$.

But this says $\|x - Px\|^2 = 0$, so $x - Px = 0$ and thus $x = Px \in S$, which is what we wanted to show.

3 Problem 3

3.1 Part a

We compute

$$\begin{aligned} \|e_0\|^2 &= \int_0^1 1^2 dx = 1 \\ \|e_1\|^2 &= \int_0^1 3(2x-1)^2 dx = \frac{1}{2}(2x-1)^2 \Big|_0^1 = 1 \\ \langle e_0, e_1 \rangle &= \int_0^1 \sqrt{3}(2x-1) dx = \frac{\sqrt{3}}{4}(2x-1) \Big|_0^1 = 0. \end{aligned}$$

which verifies that this is an orthonormal system.

3.2 Part b

We first note that this system spans the degree 1 polynomials in $L^2([0, 1])$, since we have

$$\begin{bmatrix} 1 & 0 \\ 2\sqrt{3} & \sqrt{3} \end{bmatrix} [1, x]^t = [e_0, e_1]$$

which exhibits a matrix that changes basis from $\{1, x\}$ to $\{e_0, e_1\}$ which is invertible, so both sets span the same subspace.

Thus the closest degree 1 polynomial f to x^3 is given by the projection onto this subspace, and since $\{e_i\}$ is orthonormal this is given by

$$\begin{aligned} f(x) &= \sum_i \langle x^3, e_i \rangle e_i \\ &= \langle x^3, 1 \rangle 1 + \langle x^3, \sqrt{3}(2x-1) \rangle \sqrt{3}(2x-1) \\ &= \int_0^1 x^2 dx + \sqrt{3}(2x-1) \int_0^1 \sqrt{3}x^2(2x-1) dx \\ &= \frac{1}{3} + \sqrt{3}(2x-1) \frac{\sqrt{3}}{6} \\ &= x - \frac{1}{6}. \end{aligned}$$

We can also compute

$$\begin{aligned} \|f - g\|_2^2 &= \int_0^1 (x^2 - x + \frac{1}{6})^2 dx \\ &= \frac{1}{180} \\ \implies \|f - g\|_2 &= \frac{1}{\sqrt{180}}. \end{aligned}$$

4 Problem 5

5 Part 1

We use the following algorithm: given $\{v\}_i$, we set

- $e_1 = v_1$, and then normalize to obtain $\hat{e}_1 = e_1/\|e_1\|$
- $e_i = v_i - \sum_{k \leq i-1} \langle v_i, \hat{e}_k \rangle \hat{e}_k$

The result set $\{\hat{e}_i\}$ is the orthonormalized basis.

We set $e_1 = 1$, and check that $\|e_1\| = 1$, and thus set $\hat{e}_1 = 1$.

We then set

$$\begin{aligned}
e_2 &= x - \langle x, \hat{e}_1 \rangle \hat{e}_1 \\
&= x - \langle x, 1 \rangle 1 \\
&= x - \int_{-1}^1 \frac{1}{\sqrt{2}} x \, dx \\
&= x - \int \text{odd function} \\
&= x,
\end{aligned}$$

and so $e_2 = x$. We can then check that

$$\|e_2\| = \left(\int_{-1}^1 x^2 \, dx \right)^{1/2} = \sqrt{\frac{2}{3}},$$

and so we set $\hat{e}_2 = \sqrt{\frac{3}{2}}x$.
