1 Problem 1

1.1 Part 1

In order for IS to be a submodule of A , we need to show the following implication:

$$x \in IS, a \in A \implies xa, ax \in IS.$$

Suppose $x \in IS$. Then by definition, $x = \sum_{i=1}^n r_i a_i$ for some $r_i \in R, a_i \in A$.

But then

$$\begin{aligned} xa &= \left(\sum_{i=1}^n r_i a_i \right) a \\ &= \sum_{i=1}^n r_i a_i a \\ &:= \sum_{i=1}^n r_i a'_i, \end{aligned}$$

where $a'_i := a_i a$ for each i , which is still an element of A since A itself is a module and thus closed under multiplication.

But this expresses xa as an element of IS . Similarly, we have

$$\begin{aligned}
ax &= a \left(\sum_{i=1}^n r_i a_i \right) \\
&= \sum_{i=1}^n a r_i a_i a \\
&:= \sum_{i=1}^n r_i a a_i,
\end{aligned}$$

$$:= \sum_{i=1}^n r_i a'_i,$$

and so $ax \in IS$ as well.
