## Contents

### 1 Notation 10

- Acyclic
- Alexander duality
- Basis
  - For an  $R$ -module  $M$ , a basis  $B$  is a linearly independent generating set.
- Boundary
- Boundary of a manifold
  - Points  $x \in M^n$  defined by

$$\partial M = \{x \in M : H_n(M, M - \{x\}; \mathbb{Z}) = 0\}$$

- Cap Product
  - Denoting  $\Delta^p \xrightarrow{\sigma} X \in C_p(X; G)$ , a map that sends pairs ( $p$ -chains,  $q$ -cochains) to ( $p - q$ )-chains  $\Delta^{p-q} \rightarrow X$  by

$$\begin{aligned} H_p(X; R) \times H^q(X; R) &\xrightarrow{\cap} H_{p-q}(X; R) \\ \sigma \cap \psi &= \psi(F_0^q(\sigma))F_q^p(\sigma) \end{aligned}$$

where  $F_i^j$  is the face operator, which acts on a simplicial map  $\sigma$  by restriction to the face spanned by  $[v_i \dots v_j]$ , i.e.  $F_i^j(\sigma) = \sigma|_{[v_i \dots v_j]}$ .

- Cellular Homology
- CW Cell
  - An  $n$ -cell of  $X$ , say  $e^n$ , is the image of a map  $\Phi : B^n \rightarrow X$ . That is,  $e^n = \Phi(B^n)$ . Attaching an  $n$ -cell to  $X$  is equivalent to forming the space  $B^n \coprod_f X$  where  $f : \partial B^n \rightarrow X$ .
    - \* A 0-cell is a point.
    - \* A 1-cell is an interval  $[-1, 1] = B^1 \subset \mathbb{R}^1$ . Attaching requires a map from  $S^0 = \{-1, +1\} \rightarrow X$
    - \* A 2-cell is a solid disk  $B^2 \subset \mathbb{R}^2$  in the plane. Attaching requires a map  $S^1 \rightarrow X$ .

\* A 3-cell is a solid ball  $B^3 \subset \mathbb{R}^3$ . Attaching requires a map from the sphere  $S^2 \rightarrow X$ .

- Cellular Map

- A map  $X \xrightarrow{f} Y$  is said to be cellular if  $f(X^{(n)}) \subseteq Y^{(n)}$  where  $X^{(n)}$  denotes the  $n$ - skeleton.

- Chain

- An element  $c \in C_p(X; R)$  can be represented as the singular  $p$  simplex  $\Delta^p \rightarrow X$ .

- Chain Homotopy

- Given two maps between chain complexes  $(C_*, \partial_C) \xrightarrow{f, g} (D_*, \partial_D)$ , a chain homotopy is a family  $h_i : C_i \rightarrow B_{i+1}$  satisfying

$$f_i - g_i = \partial_{B,i-1} \circ h_n + h_{i+1} \circ \partial_{A,i}$$

- Chain Map

- A map between chain complexes  $(C_*, \partial_C) \xrightarrow{f} (D_*, \partial_D)$  is a chain map iff each component  $C_i \xrightarrow{f_i} D_i$  satisfies

$$f_{i-1} \circ \partial_{C,i} = \partial_{D,i} \circ f_i$$

(i.e this forms a commuting ladder)

- Closed manifold

- A manifold that is compact, with or without boundary.

- Coboundary

- Cochain

- An cochain  $c \in C^p(X; R)$  is a map  $c \in \text{hom}(C_p(X; R), R)$  on chains.

- Cocycle
- Colimit
- Compact
  - A space  $X$  is compact iff every open cover of  $X$  has a finite subcover.
- Cone
  - For a space  $X$ , defined as

$$CX = \frac{X \times I}{X \times \{0\}}$$

Example: The cone on the circle  $CS^1$

Note that the cone embeds  $X$  in a contractible space  $CX$ .

- Contractible
  - A space is contractible if its identity map is nullhomotopic.
- Contractible
- Coproduct
- Covering Space
- Cup Product
  - A map taking pairs ( $p$ -cocycles,  $q$ -cocycles) to  $(p+q)$ -cocycles by

$$H^p(X; R) \times H^q(X; R) \xrightarrow{\smile} H^{p+q}(X; R)$$

$$(a \cup b)(\sigma) = a(\sigma \circ I_0^p) \ b(\sigma \circ I_p^{p+q})$$

where  $\Delta^{p+q} \xrightarrow{\sigma} X$  is a singular  $p+q$  simplex and

$$I_i^j : [i, \dots, j] \hookrightarrow \Delta^{p+q}$$

is an embedding of the  $(j-i)$ -simplex into a  $(p+q)$ -simplex. On a manifold, the cup product is Poincare dual to the intersection of submanifolds. \* Applications -  $T^2 \not\cong S^2 \vee S^1 \vee S^1$ . Proof: todo

- CW Complex

- Cycle
- Deck Transformation
- Deformation
- Deformation Retract
  - A map  $r$  in  $A \xleftarrow{\iota} X$  that is a retraction (so  $r \circ \iota = \text{id}_A$ ) **that also satisfies**  $\iota \circ r \simeq \text{id}_X$ .
  - Note that this is equality in one direction, but only homotopy equivalence in the other.
- Degree of a Map
- Derived Functor
  - For a functor  $T$  and an  $R$ -module  $A$ , a *left derived functor*  $(L_n T)$  is defined as  $h_n(TP_A)$ , where  $P_A$  is a projective resolution of  $A$ .
- Dimension of a manifold
  - For  $x \in M$ , the only nonvanishing homology group  $H_i(M, M - \{x\}; \mathbb{Z})$
- Direct Limit
- Direct Product
- Direct Sum
- Eilenberg-MacLane Space
- Euler Characteristic
- Exact Functor
  - A functor  $T$  is *right exact* if a short exact sequence
 
$$0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$$
 yields an exact sequence
 
$$\dots TA \rightarrow TB \rightarrow TC \rightarrow 0,$$
 and is *left exact* if it yields
 
$$0 \rightarrow TA \rightarrow TB \rightarrow TC \rightarrow \dots$$
 Thus a functor is exact iff it is both left and right exact, yielding
 
$$0 \rightarrow TA \rightarrow TB \rightarrow TC \rightarrow 0$$
  - Examples:
    - \*  $\cdot \otimes_R \cdot$  is a right exact bifunctor.
- Exact Sequence
- Excision
- Ext Group
- Flat

- An  $R$ -module is flat if  $A \otimes_R \cdot$  is an exact functor.
- Free and Properly Discontinuous
- Free module
  - A  $R$ -module  $M$  with a basis  $S = \{s_i\}$  of generating elements. Every such module is the image of a unique map  $\mathcal{F}(S) = R^S \twoheadrightarrow M$ , and if  $M = \langle S \mid \mathcal{R} \rangle$  for some set of relations  $\mathcal{R}$ , then  $M \cong R^S / \mathcal{R}$ .
- Free Product
- Free product with amalgamation
- Fundamental Class
  - For a connected, closed, orientable manifold,  $[M]$  is a generator of  $H_n(M; \mathbb{Z}) = \mathbb{Z}$ .
- Fundamental classes
- Fundamental Group
- Generating Set
  - $S = \{s_i\}$  is a generating set for an  $R$ -module  $M$  iff

$$x \in M \implies x = \sum r_i s_i$$

for some coefficients  $r_i \in R$  (where this sum may be infinite).

- Gluing Along a Map
- Group Ring
- Homologous
- Homotopic
- Homotopy
- Homotopy Class
- Homotopy Equivalence
- Homotopy Extension Property
- Homotopy Groups
- Homotopy Lifting Property
- Injection
  - A map  $\iota$  with a **left** inverse  $f$  satisfying  $f \circ \iota = \text{id}$
- Intersection Pairing For a manifold  $M$ , a map on homology defined by

$$\begin{aligned} H_i M \otimes H_j M &\rightarrow H_{i+j} X \\ \alpha \otimes \beta &\mapsto \langle \alpha, \beta \rangle \end{aligned}$$

obtained by conjugating the cup product with Poincare Duality, i.e.

$$\langle \alpha, \beta \rangle = [M] \frown ([\alpha]^\vee \smile [\beta]^\vee)$$

Then, if  $[A], [B]$  are transversely intersecting submanifolds representing  $\alpha, \beta$ , then

$$\langle \alpha, \beta \rangle = [A \cap B]$$

.

If  $\widehat{i} = j$  then  $\langle \alpha, \beta \rangle \in H_0 M = \mathbb{Z}$  is the signed number of intersection points.

- Inverse Limit
- Intersection Pairing
  - The pairing obtained from dualizing Poincare Duality to obtain

$$F(H_i M) \otimes F(H_{n-i} M) \rightarrow \mathbb{Z}$$

Computed as an oriented intersection number between two homology classes (perturbed to be transverse).

- Intersection Form
  - The nondegenerate bilinear form cohomology induced by the Kronecker Pairing:

$$I : H^k(M_n) \times H^{n-k}(M^n) \rightarrow \mathbb{Z}$$

where  $n = 2k$ .

- \* When  $k$  is odd,  $I$  is skew-symmetric and thus a *symplectic form*.
- \* When  $k$  is even (and thus  $n \equiv 0 \pmod{4}$ ) this is a symmetric form.
- \* Satisfies  $I(x, y) = (-1)^{k(n-k)} I(y, x)$
- Kronecker Pairing

- A map pairing a chain with a cochain, given by

$$\begin{aligned} H^n(X; R) \times H_n(X; R) &\rightarrow R \\ ([\psi, \alpha]) &\mapsto \psi(\alpha) \end{aligned}$$

which is a nondegenerate bilinear form.

- Kronecker Product
- Lefschetz duality
- Lefschetz Number
- Lens Space
- Local Degree
  - At a point  $x \in V \subset M$ , a generator of  $H_n(V, V - \{x\})$ . The degree of a map  $S^n \rightarrow S^n$  is the sum of its local degrees.
- Local Orientation

- Limit
- Linear Independence
  - A generating  $S$  for a module  $M$  is linearly independent if  $\sum r_i s_i = 0_M \implies \forall i, r_i = 0$  where  $s_i \in S, r_i \in R$ .
- Local homology
  - $H_n(X, X - A; \mathbb{Z})$  is the local homology at  $A$ , also denoted  $H_n(X \mid A)$
- Local Homology
- Local orientation of a manifold
  - At a point  $x \in M^n$ , a choice of a generator  $\mu_x$  of  $H_n(M, M - \{x\}) = \mathbb{Z}$ .
- Long exact sequence
- Loop Space
- Manifold
  - An  $n$ -manifold is a Hausdorff space in which each neighborhood has an open neighborhood homeomorphic to  $\mathbb{R}^n$ .
- Manifold with boundary
  - A manifold in which open neighborhoods may be isomorphic to either  $\mathbb{R}^n$  or a half-space  $\{\mathbf{x} \in \mathbb{R}^n \mid x_i > 0\}$ .
- Mapping Cone
- Mapping Cylinder
- Mapping Path Space
- Mayer-vietoris Sequence
- Monodromy
- Moore Space
- N-cell
- N-connected
- Nullhomotopic
  - A map  $X \xrightarrow{f} Y$  is nullhomotopic if it is homotopic to a constant map  $X \xrightarrow{c} \{y_0\}$ ; that is, there exists a homotopy
- Orientable manifold
  - A manifold for which an orientation exists, see “Orientation of a Manifold”.
- Orientation Cover

- For any manifold  $M$ , a two sheeted orientable covering space  $\tilde{M}_o$ .  $M$  is orientable iff  $\tilde{M}$  is disconnected. Constructed as

$$\tilde{M} = \coprod_{x \in M} \left\{ \mu_x \mid \mu_x \text{ is a local orientation} \right\}$$

- Orientation of a manifold

- A family of  $\{\mu_x\}_{x \in M}$  with local consistency: if  $x, y \in U$  then  $\mu_x, \mu_y$  are related via a propagation.
  - \* Formally, a function

$$M^n \rightarrow \coprod_{x \in M} H(X \mid \{x\})$$

$$x \mapsto \mu_x$$

such that  $\forall x \exists N_x$  in which  $\forall y \in N_x$ , the preimage of each  $\mu_y$  under the map  $H_n(M \mid N_x) \twoheadrightarrow H_n(M \mid y)$  is a single generator  $\mu_{N_x}$ .

- TFAE:

- \*  $M$  is orientable.
- \* The map  $W : (M, x) \rightarrow \mathbb{Z}_2$  is trivial.
- \*  $\tilde{M}_o = M \coprod \mathbb{Z}_2$  (two sheets).
- \*  $\tilde{M}_o$  is disconnected
- \* The projection  $\tilde{M}_o \rightarrow M$  admits a section.

- Oriented manifold

- Path

- Path Lifting Property

- Perfect Pairing

- A pairing alone is an  $R$ -bilinear module map, or equivalently a map out of a tensor product since  $p : M \otimes_R N \rightarrow L$  can be partially applied to yield  $\varphi : M \rightarrow L^N = \text{hom}_R(N, L)$ . A pairing is **perfect** when  $\varphi$  is an isomorphism.
  - \* Example:  $\det_M : k^2 \times k^2 \rightarrow k$

- Poincare Duality

- For a closed, orientable  $n$ -manifold, following map  $[M] \frown \cdot$  is an isomorphism:

$$D : H^k(M; R) \rightarrow H_{n-k}(M; R)$$

$$D(\alpha) = [M] \frown \alpha$$

- Projective Resolution

- Properly Discontinuous

- Pullback

- Pushout

- Quasi-isomorphism

- R-orientability
- Relative boundaries
- Relative cycles
- Relative homotopy groups
- Retraction
  - A map  $r$  in  $A \xleftarrow{\iota} X$  satisfying

$$r \circ \iota = \text{id}_A.$$

Equivalently  $X \twoheadrightarrow_r A$  and  $r|_A = \text{id}_A$ . If  $X$  retracts onto  $A$ , then  $i_*$  is injective.

- Short exact sequence
- Simplicial Complex
- Simplicial Map
  - For a map

$$K \xrightarrow{f} L$$

between simplicial complexes,  $f$  is a simplicial map if for any set of vertices  $\{v_i\}$  spanning a simplex in  $K$ , the set  $\{f(v_i)\}$  are the vertices of a simplex in  $L$ .

- Simply Connected
- Singular Chain

$$x \in C_n(x) \implies X = \sum_i n_i \sigma_i = \sum_i n_i (\Delta^n \xrightarrow{\sigma_i} X)$$

- Singular Cochain

$$x \in C^n(x) \implies X = \sum_i n_i \psi_i = \sum_i n_i (\sigma_i \xrightarrow{\psi_i} X)$$

- Singular Homology
- Smash Product
- Surjection

- A map  $\pi$  with a **right** inverse  $f$  satisfying

$$\pi \circ f = \text{id}$$

- Suspension Compact represented as  $\Sigma X = CX \coprod_{\text{id}_X} CX$ , two cones on  $X$  glued along  $X$ .  
Explicitly given by

$$\Sigma X = \frac{X \times I}{(X \times \{0\}) \cup (X \times \{1\}) \cup (\{x_0\} \times I)}$$

- 
- Tor Group
    - For an  $R$ -module

$$\mathrm{Tor}_R^n(\cdot, B) = L_n(\cdot \otimes_R B)$$

where  $L_n$  denotes the  $n$ th left derived functor.

- Universal Cover
- Universal Coefficient Theorem for Cohomology
- Universal Coefficient Theorem for Change of Coefficient Ring
- Weak Homotopy Equivalence
- Weak Topology
- Wedge Product

# 1 | Notation

- $C_X$
- $\Sigma(X)$
- $\Sigma_g$
- $\iota, \pi$
- $\widehat{i+j}$ : for an  $n$ -dimensional manifold, the “dual” dimension  $\widehat{i+j} := n - (i+j)$ .
