## Background: Generating Functions

Fix  $q$  a prime and  $\mathbb{F} := \mathbb{F}_q$  the (unique) finite field with  $q$  elements, along with its (unique) degree  $n$  extensions

$$\mathbb{F}_{q^n} = \left\{ x \in \bar{\mathbb{F}}_q \mid x^{q^n} - x = 0 \right\} \quad \forall n \in \mathbb{Z}^{\geq 2}$$

## Definition (Projective Algebraic Varieties)

Let  $J = \langle f_1, \dots, f_M \rangle \trianglelefteq k[x_0, \dots, x_n]$  be an ideal, then a *projective algebraic variety*  $X \subset \mathbb{P}_{\mathbb{F}}^n$  can be described as

$$X = V(J) = \left\{ \mathbf{x} \in \mathbb{P}_{\mathbb{F}}^n \mid f_1(\mathbf{x}) = \dots = f_M(\mathbf{x}) = \mathbf{0} \right\}$$

where  $J$  is generated by *homogeneous* polynomials in  $n + 1$  variables, i.e. there is a fixed  $d = \deg f_i \in \mathbb{Z}^{\geq 1}$  such that

$$f(\mathbf{x}) = \sum_{\substack{\mathbf{l}=(i_1, \dots, i_n) \\ \sum_j i_j = d}} \alpha_{\mathbf{l}} \cdot x_0^{i_1} \cdots x_n^{i_n} \quad \text{and} \quad f(\lambda \cdot \mathbf{x}) = \lambda^d f(\mathbf{x}), \lambda \in \mathbb{F}^{\times}.$$

Background:  
Generating  
Functions

Zeta  
Functions

Examples

- For a fixed variety  $X$ , we can consider its  $\mathbb{F}$ -points  $X(\mathbb{F})$ .
  - Note that  $\#X(\mathbb{F}) < \infty$  is an integer
- For any  $L/\mathbb{F}$ , we can also consider  $X(L)$ 
  - In particular, we can consider  $X(\mathbb{F}_{q^n})$  for any  $n \geq 2$ .
  - We again have  $\#X(\mathbb{F}_{q^n}) < \infty$  and are integers for every such  $n$ .
- So we can consider the sequence

$$[N_1, N_2, \dots, N_n, \dots] := [\#X(\mathbb{F}), \#X(\mathbb{F}_{q^2}), \dots, \#X(\mathbb{F}_{q^n}), \dots].$$

- Idea: associate some generating function (a formal power series) encoding sequence, e.g.

$$F(z) = \sum_{n=1}^{\infty} N_n z^n = N_1 z + N_2 z^2 + \dots.$$

# Why Generating Functions?

Zeta  
Functions

Examples

Note that for such an ordinary generating functions, the coefficients are related to the real-analytic properties of  $F$ : we can easily recover the coefficients in the following way:

$$[z^n] \cdot F(z) = [z^n] \cdot T_{F,z=0}(z) = \frac{1}{n!} \left( \frac{\partial}{\partial z} \right)^n F(z) \Big|_{z=0} = N_n.$$

They are also related to the complex analytic properties: using the Residue theorem,

$$[z^n] \cdot F(z) := \frac{1}{2\pi i} \oint_{\mathbb{S}^1} \frac{F(z)}{z^{n+1}} dz = \frac{1}{2\pi i} \oint_{\mathbb{S}^1} \frac{N_n}{z} dz = N_n.$$

*The latter form is very amenable to computer calculation.*

# Why Generating Functions?

CRAG

Zeta  
Functions

Examples

An OGF is an infinite series, which we can interpret as an analytic function  $\mathbb{C} \rightarrow \mathbb{C}$  – in nice situations, we can hope for a closed-form representation.

A useful example: by integrating a geometric series we can derive

$$\begin{aligned}\frac{1}{1-z} &= \sum_{n=0}^{\infty} z^n && (= 1 + z + z^2 + \cdots) \\ \Rightarrow \int \frac{1}{1-z} &= \int \sum_{n=0}^{\infty} z^n \\ &= \sum_{n=0}^{\infty} \int z^n \quad \text{for } |z| < 1 \quad \text{by uniform convergence} \\ &= \sum_{n=0}^{\infty} \frac{1}{n+1} z^{n+1} \\ \Rightarrow -\log(1-z) &= \sum_{n=1}^{\infty} \frac{z^n}{n} && \left( = z + \frac{z^2}{2} + \frac{z^3}{3} + \cdots \right).\end{aligned}$$

For completeness, also recall that

$$\exp(z) := \sum_{n=0}^{\infty} \frac{z^n}{n!}$$

# Zeta Functions

# Definition: Local Zeta Function

Problem: count points of a (smooth?) projective variety  $X/\mathbb{F}$  in all degree  $n$  extensions of  $\mathbb{F}$ .

## Definition (Local Zeta Function)

The *local zeta function* of  $X$  is the following formal power series:

$$Z_X(z) = \exp \left( \sum_{n=1}^{\infty} N_n \frac{z^n}{n} \right) \in \mathbb{Q}[[z]] \quad \text{where} \quad N_n := \#X(\mathbb{F}_n).$$

Note that

$$\begin{aligned} z \left( \frac{\partial}{\partial z} \right) \log Z_X(z) &= z \frac{\partial}{\partial z} \left( N_1 z + N_2 \frac{z^2}{2} + N_3 \frac{z^3}{3} + \cdots \right) \\ &= z(N_1 + N_2 z + N_3 z^2 + \cdots) \quad (\text{unif. conv.}) \\ &= N_1 z + N_2 z^2 + \cdots = \sum_{n=1}^{\infty} N_n z^n, \end{aligned}$$

which is an *ordinary* generating function for the sequence  $(N_n)$ .

# Simple but Useful Example: A Point

CRAIG

D. Zack  
Garza

Background:  
Generating  
Functions

Zeta  
Functions

Examples

Take  $X = \{\text{pt}\} = V(\{f(x) = 0\})/\mathbb{F}$  a single point over  $\mathbb{F}$ , then

$$\#X(\mathbb{F}) := N_1 = 1$$

$$\#X(\mathbb{F}_2) := N_2 = 1$$

$$\vdots$$

$$\#X(\mathbb{F}_n) := N_n = 1$$

$$\vdots$$

and so

$$\begin{aligned} Z_{\{\text{pt}\}}(z) &= \exp\left(1 \cdot z + 1 \cdot \frac{z^2}{2} + 1 \cdot \frac{z^3}{3} + \cdots\right) \\ &= \exp(-\log(1 - z)) \\ &= \frac{1}{1 - z}. \end{aligned}$$

*Notice:  $Z$  admits a closed form **and** is a rational function.*

## Example: The Affine Line:

CRAG

D. Zack  
Garza

Background:  
Generating  
Functions

Zeta  
Functions

Examples

Take  $X = \mathbb{A}^1/\mathbb{F}$  the affine line over  $\mathbb{F}$ , then We can write

$$\mathbb{A}^1(\mathbb{F}_n) = \left\{ \mathbf{x} = [x_1] \mid x_1 \in \mathbb{F}_n \right\}$$

as the set of one-component vectors with entries in  $\mathbb{F}_n$ , so

$$X(\mathbb{F}) = q$$

$$X(\mathbb{F}_2) = q^2$$

$$\vdots$$

$$X(\mathbb{F}_n) = q^n.$$

Then

$$\begin{aligned} Z_X(z) &= \exp \left( \sum_{n=1}^{\infty} q^n \frac{z^n}{n} \right) \\ &= \exp(-\log(1 - qz)) \\ &= \frac{1}{1 - qz}. \end{aligned}$$
