1.3.2	Chapter 7	3
1.3.3	Topics	3
1.4	Content	3
1.5	Linear Lie Algebras	4

1 Monday August 12

The material for this class will roughly come from Humphrey, Chapters 1 to 5. There is also a useful appendix which has been uploaded to the ELC system online.

1.1 Overview

Here is a short overview of the topics we expect to cover:

1.1.1 Chapter 2

- Ideals, solvability, and nilpotency
- Semisimple Lie algebras
 - These have a particularly nice structure and representation theory
- Determining if a Lie algebra is semisimple using Killing forms
- Weyl's theorem for complete reducibility for finite dimensional representations
- Root space decompositions

1.1.2 Chapter 3-4

We will describe the following series of correspondences:

1.2 Classification

The classical Lie algebras can be essentially classified by certain classes of diagrams:

1.3 Chapters 4-5

These cover the following topics:

- Conjugacy classes of Cartan subalgebras
- The PBW theorem for the universal enveloping algebra
- Serre relations

1.3.1 Chapter 6

Some important topics include:

- Weight space decompositions
- Finite dimensional modules
- Character and the Harish-Chandra theorem
- The Weyl character formula
 - This will be computed for the specific Lie algebras seen earlier

We will also see the type A_ℓ algebra used for the first time; however, it differs from the other types in several important/significant ways.

1.3.2 Chapter 7

Skip!

1.3.3 Topics

Time permitting, we may also cover the following extra topics:

- Infinite dimensional Lie algebras [Carter 05]
- BGG Cat- \mathcal{O} [Humphrey 08]

1.4 Content

Fix F a field of characteristic zero – note that prime characteristic is closer to a research topic.

Definition 1. A **Lie Algebra** \mathfrak{g} over F is an F -vector space with an operation denoted the Lie bracket,

$$\begin{aligned} [\cdot, \cdot] : \mathfrak{g} \times \mathfrak{g} &\rightarrow \mathfrak{g} \\ (x, y) &\mapsto [x, y]. \end{aligned}$$

satisfying the following properties:

- $[\cdot, \cdot]$ is bilinear
- $[x, x] = 0$
- The Jacobi identity:

$$[x, [y, z]] + [y, [x, z]] + [z, [x, y]] = 0.$$

Exercise 1. Show that $[x, y] = -[y, x]$.

Definition 2. Two Lie algebras $\mathfrak{g}, \mathfrak{g}'$ are said to be isomorphic if $\varphi([x, y]) = [\varphi(x), \varphi(y)]$.

1.5 Linear Lie Algebras

Let $V = \mathbb{F}^n$, and define $\text{End}(V) = \{f : V \rightarrow V \mid V \text{ is linear}\}$. We can then define $\mathfrak{gl}(n, V)$ by setting $[x, y] = (x \circ y) - (y \circ x)$.

Exercise 2. Verify that V is a Lie algebra.

Definition 3. Define

$$\mathfrak{sl}(n, V) = \{f \in \mathfrak{gl}(n, V) \mid \text{Tr}(f) = 0\}.$$

(Note the different in definition compared to the lie *group* $\text{SL}(n, V)$.)

Definition 4. A *subalgebra* of a Lie algebra is a vector subspace that is closed under the bracket.

Definition 5. The symplectic algebra

$$\mathfrak{sp}(2\ell, F) = \left\{ A \in \mathfrak{gl}(2\ell, F) \mid MA - A^T M = 0 \right\} \text{ where } M = \left(\begin{array}{c|c} 0 & I_n \\ \hline -I_n & 0 \end{array} \right).$$

Definition 6. The orthogonal algebra

$$\mathfrak{so}(2\ell, F) = \left\{ A \in \mathfrak{gl}(2\ell, F) \mid MA - A^T M = 0 \right\} \text{ where}$$

$$M = \begin{cases} \left(\begin{array}{c|c|c} 1 & 0 & \\ \hline 0 & 0 & I_n \\ \hline & -I_n & 0 \end{array} \right) & n = 2\ell + 1 \text{ odd,} \\ \left(\begin{array}{c|c} 0 & I_n \\ \hline -I_n & 0 \end{array} \right) & \text{else.} \end{cases}$$

Proposition 7. The dimensions of these algebras can be computed;

- The dimension of $\mathfrak{gl}(n, \mathbb{F})$ is n^2 , and has basis $\{e_{i,j}\}$ the matrices if a 1 in the i, j position and zero elsewhere. x is determined to force the trace to be zero
- For type A_ℓ , we have $\dim \mathfrak{sl}(n, \mathbb{F}) = (\ell + 1)^2 - 1$.
- For type C_ℓ , we have $\dim \mathfrak{sp}(n, \mathbb{F}) = \ell^2 + 2 \left(\frac{\ell(\ell+1)}{2} \right)$, and so elements here

$$\left(\begin{array}{cc} A & B = B^t \\ C = C^t & A^t \end{array} \right).$$

- For type D_ℓ we have

$$\dim \mathfrak{so}(2\ell, \mathbb{F}) = \dim \left\{ \left(\begin{array}{cc} A & B = -B^t \\ C = -C^t & -A^t \end{array} \right) \right\},$$

which turns out to be $2\ell^2 - \ell$.

- For type B_ℓ , we have $\dim \mathfrak{so}(2\ell, \mathbb{F}) = 2\ell^2 - \ell + 2\ell = 2\ell^2 + \ell$, with elements of the form

$$\left(\begin{array}{c|cc} 0 & M & N \\ \hline -N^t & A & C = C^t \\ -M^t & B = B^t & -A^t \end{array} \right).$$

Exercise 3. Use the relation $MA = A^{tM}$ to reduce restrictions on the blocks.

Theorem 8. These are *all* of the isomorphisms between any of these types of algebras, in any dimension.
