Question: how do we define  $h_{V,D}$ ?

Answer: write  $D = D_1 - D_2$  which are (very) ample divisors and basepoint free. We then obtain embeddings

$$\begin{aligned}\varphi_1 : V &\hookrightarrow \mathbb{P}_K^{n_1} \\ \varphi_2 : V &\hookrightarrow \mathbb{P}_K^{n_2}.\end{aligned}$$

So write

$$h_{V,D}(p) = h(\varphi_1(p)) - h(\varphi_2(p)) + O(1)$$

### Example 1.1.

For  $E/K$  an elliptic curve,

- $2[0]$  is an ample divisor
- $3[0]$  is a very ample divisor.

Let  $K$  be a local field (i.e.  $\mathbb{C}, \mathbb{R}$ , a  $p$ -adic field, or  $\mathbb{F}_q((t))$  formal Laurent series) and  $A/K$  be an abelian variety; we want to understand  $A(K)$ . We know this has the structure of compact abelian  $K$ -analytic Lie group.

- Question 1: What does Lie theory say?
- Question 2: What extra information comes from  $A/K$  being a  $g$ -dimensional abelian variety?

If  $K = \mathbb{C}$ , then  $A(K) \cong (\mathbb{R}/\mathbb{Z})^{2g}$ . If  $K = \mathbb{R}$ , then  $A(K) \cong (\mathbb{R}/\mathbb{Z})^g \oplus \prod_{i=1}^d \mathbb{Z}/2\mathbb{Z}$  where  $0 \leq d \leq g$ .

---

Fix  $d$ , then

- Let  $E_1/\mathbb{R}$  with  $\Delta > 0$  (and thus 3 real roots), then  $E_1(\mathbb{R})[2] = (\mathbb{Z}/2\mathbb{Z})^2$ .
- Let  $E_2/\mathbb{R}$  with  $\Delta < 0$  (and 1 real root), then  $E_2(\mathbb{R})[2] = \mathbb{Z}/2\mathbb{Z}$ .

By taking products of  $E_1$  and  $E_2$ , i.e.  $A = (E_1)^d \times (E_2)^{g-d}$ .

Todo: find reference in Silverman?

**Fact**  $A(K)$  is totally disconnected and homeomorphic to a Cantor set.

**Fact (From Lie Theory, Serre p.116)** If  $G$  is an abelian compact  $K$ -analytic Lie group, then there exists a filtration by open finite index subgroups

$$G = G^0 \supset G^1 \supset \dots \supset G^n \supset \dots$$

such that

1. The successive quotients are finite, and each  $G^i$  is *standard*, i.e. obtained by evaluating a formal group law on  $(\mathfrak{m}^i)^g$ .
2.  $\bigcap_i G^i = (0)$ .
3.  $G^i/G^{i+1}$  has exponent  $p$ , i.e. it is a finite dimensional  $\mathbb{Z}/p\mathbb{Z}$ -vector space.
4.  $G'[\text{tors}] = G'[p^\infty]$ , all of the prime-to- $p$  torsion is  $p$ -primary.

Todo: define  $p$ -primary torsion.

What structure theorem does this give?
