1 Chapter 1

1.1 Within Chapter

Proposition 1.1: Fix an ideal $\mathfrak{a} \subseteq R$. There is a correspondence

$$\left\{\mathfrak{b}\ \middle|\ \mathfrak{a}\subseteq\mathfrak{b}\trianglelefteq R\right\}\iff \left\{\tilde{\mathfrak{b}}\trianglelefteq R/\mathfrak{a}\right\}.$$

Proof: Adapted from proof for groups here: https://math.stackexchange.com/a/955413/147053.

Let $f: R \to T$ be any ring homomorphism and let S(R), S(T) denote the lattices of subrings of R, T respectively. Then f induces two maps:

$$F: S(R) \to S(T)$$

 $H \mapsto f(H)$

$$F^{-1}: S(T) \to S(R)$$
$$K \mapsto f^{-1}(K).$$

It follows that

- $H \leq R \implies F(H) \leq \text{im } f$, by the subring test
 - Subring test: contains 1, closed under multiplication/subtraction.
 - Properties of ring homomorphisms: f(sa + b) = sf(a) + f(b) and f(1) = 1.
 - Thus if f is not surjective, F is not surjective either.

- $K \le T \implies \ker f \subseteq F^{-1}(K)$.
 - Follows because subrings contain 0, and $H \in \ker F \implies f(H) = 0_T \in K$.
 - Thus if there is any subring H that doesn't contain ker f, F^{-1} is not surjective.

The claim is that if you restrict to

- $S'(R) := \{ H \le R \mid \ker f \subseteq H \}$ and
- $S'(T) := \{ K \le T \mid K \subseteq \text{im } f \},$

this is a bijection.

This follows from the fact that

- $(F \circ F^{-1})(K) = K \bigcap \text{im } f \leq T$
 - No clear motivation for why it's *this* specific thing, but the inclusions are easy to check.
- $(F^{-1} \circ F)(H) = \langle H, \ker f \rangle \leq S$.
 - Inclusions easy to check, need to take subring generated since F(H) is a pushforward/direct image, which don't preserve sub-structures in general.

So we take the projection $f = \pi : R \to R/\mathfrak{a}$, then

- $K \subseteq \text{im } \pi \implies K \bigcap \text{im } \pi = K \implies (F \circ F^{-1})(K) = K$,
- $\ker \pi \subseteq H \implies \langle H, \ker \pi \rangle = H \implies (F^{-1} \circ F)(H) = H,$

so both directions are surjections. Restricting to just those subrings that are ideals preserves this bijection. Moreover, $\ker \pi = \mathfrak{a}$ so S'(R) is the set of ideals containing \mathfrak{a} , and $\operatorname{im} \pi = R/\mathfrak{a}$, so S'(T) is the set of ideals of the quotient.

Proposition 1.2: TFAE

- 1. R is a field
- 2. R is simple, i.e. the only ideals of R are 0, R.
- 3. Every nonzero homomorphism $\phi: R \to S$ for S an arbitrary ring is injective.

Proof:

Lemma: $I \subseteq R$ and $1 \in I \implies I = R$. This is because $RI \subseteq I$, and $r \in R \implies r \cdot 1 \in I \implies r \in I \implies R \subseteq I$.

 $1 \implies 2$: Let $0 \neq I \leq R$ for R a field, then pick any $x \in I$, since $x^{-1} \in R$, we have $x^{-1}x = 1 \in I \implies I = R$.

 $2 \implies 3$: ker $\phi \le R$ is an ideal, so ker $\phi = 0$.

 $3 \implies 2$: Suppose $\mathfrak{a} \leq R$ and take $S = R/\mathfrak{a}$ and $\phi : R \to S$ the natural projection. ϕ is always a surjection, and since it's an injection, bijective. So $R \cong S = R/\mathfrak{a}$, forcing $\mathfrak{a} = (0)$.

Proposition: Maximal ideals are prime.

Proof: ?

Proposition: If $\mathfrak{p} \triangleleft R$ is prime, R/\mathfrak{p} is a domain. If $\mathfrak{m} \triangleleft R$ is maximal, R/\mathfrak{r} is a field.

Proof: ?

Theorem 1.3: Every ring R has a nontrivial maximal ideal $I \neq 0$, and every ideal is contained in a maximal ideal.

Proof: ?

Corollary 1.5: Every non-unit of R is contained in a maximal ideal.

Proof: ?

Proposition 1.6: If $A \setminus \mathfrak{m} \subset R^{\times}$, then A is a local ring with \mathfrak{m} its maximal ideal. If \mathfrak{m} is maximal and $1 + m \in R^{\times}$ for all $m \in \mathfrak{m}$, then A is a local ring.

Proof: ?

Proposition: If $f \in k[x_1, \dots x_n]$ is irreducible over k, then (f) is prime.

Proposition: \mathbb{Z} is a PID, and (p) is prime iff p is zero or a prime number, and every such ideal is maximal.

Proposition: $k[\{x_i\}]$ has maximal ideals that are not principal iff n > 1.

Exercise: Characterize the maximal and prime ideals of $k[x_1, \dots, x_n]$? Is this a field, domain, PID, UFD, a local ring, ...?

Proposition: Every nonzero prime ideal in a PID is maximal.

Proof: ?

Definition: The set $\operatorname{nil}(A)$ of all nilpotent elements in a ring A is the nilradical of A. The set $J(A) = \bigcap_{\mathfrak{m} \in \operatorname{Spec}_{\max}(A)} \mathfrak{m}$ is the Jacobson radical.,

Proposition 1.7: $\operatorname{nil}(A) \leq R$ is an ideal and A/\mathfrak{R} has no nonzero nilpotent elements.

Proof: ?

Proposition 1.8: $\operatorname{nil}(A) = \bigcap \mathfrak{p} \in \operatorname{Spec}(A)\mathfrak{p}$ is the intersection of all prime ideals of A.

Proof: ?

Proposition 1.9: $x \in J(A)$ iff $1 - xa \in A^{\times}$ for all $a \in A$.

Proposition: If $(m), (n) \leq \mathbb{Z}$ then $(m) \cap (n) = (\gcd(m, n))$ and (m)(n) = (mn).

Exercise: If $\mathfrak{a} \leq k[x_1, \dots, x_m]$, characterize \mathfrak{a}^n .

Exercise: Show that $\mathfrak{a},\mathfrak{b} \leq A$ are coprime iff there exist $a \in \mathfrak{a}, b \in \mathfrak{b}$ such that a+b=1.

Proposition 1.10: Let $\{mfa_i\} \leq A$ be a family of ideals and define $\phi: A \to \prod A/\mathfrak{a}_i$.

- 1. If $\{\mathfrak{a}_i\}$ are pairwise coprime, then $\prod \mathfrak{a}_i = \bigcap \mathfrak{a}_i$
- 2. ϕ is surjective iff $\{a_i\}$ are pairwise coprime.
- 3. ϕ is injective iff $\bigcap \mathfrak{a}_i = (0)$.

Exercise: Show that the union of ideals is not necessarily an ideal.

Proposition 1.11:

a. Let $\{\mathfrak{p}_i\}$ be a set of prime ideals and let $\mathfrak{a} \in \bigcup \mathfrak{p}$. Then $\mathfrak{a} \subseteq \mathfrak{p}_i$ for some i.

b. Let $\{\mathfrak{a}_i\}$ be ideals and $\mathfrak{p}\supseteq\bigcap\mathfrak{a}_i$ be prime. $\mathfrak{p}\supseteq\mathfrak{a}_i$ for some i, and if $\mathfrak{p}=\bigcap\mathfrak{a}_i$, then $\mathfrak{p}=\mathfrak{a}_i$ for

Exercise: Let $A = \mathbb{Z}$, and characterize the ideal quotient (m:n).

Exercise 1.12:

- 1. $\mathfrak{a} \subseteq (\mathfrak{a} : \mathfrak{b})$
- 2. $(\mathfrak{a}:\mathfrak{b})\mathfrak{b}\subseteq\mathfrak{a}$
- 3. $((\mathfrak{a} : \mathfrak{b}) : \mathfrak{c}) = (\mathfrak{a} : \mathfrak{bc}) = ((\mathfrak{a} : \mathfrak{c}) : \mathfrak{b})$
- 4. $(\bigcap \mathfrak{a}_i : \mathfrak{b}) = \bigcap (\mathfrak{a}_i : \mathfrak{b})$
- 5. $(\mathfrak{a}: \sum \mathfrak{b}_i) = \bigcap (\mathfrak{a}: \mathfrak{b}_i)$

Proposition: For $\mathfrak{a} \subseteq A$, $\sqrt{\mathfrak{a}}$ is an ideal.

Exercise 1.13:

- 1. $\sqrt{\mathfrak{a}} \supset \mathfrak{a}$
- 2. $\sqrt{\sqrt{\mathfrak{a}}} = \sqrt{\mathfrak{a}}$
- 3. $\sqrt{\mathfrak{a}\mathfrak{b}} = \sqrt{\mathfrak{a} \bigcap \mathfrak{b}} = \sqrt{\mathfrak{a} \bigcap \sqrt{\mathfrak{b}}}$
- 4. $\sqrt{\mathfrak{a}} = (1) \iff \mathfrak{a} = (1)$
- 5. $\sqrt{\mathfrak{a} + \mathfrak{b}} = \sqrt{\sqrt{\mathfrak{a}} + \sqrt{\mathfrak{b}}}$. 6. For \mathfrak{p} prime, $\sqrt{\mathfrak{p}^n} = \mathfrak{p}$ for all $n \ge 1$.

Proposition 1.14: $\sqrt{\mathfrak{a}} = \bigcap_{\mathfrak{a} \subseteq \mathfrak{p} \in \text{Spec}(A)} \mathfrak{p}$

Proposition 1.15: Let D be the set of zero-divisors in A. Then $D = \bigcup_{x \neq 0} \sqrt{\operatorname{Ann}(x)}$.

Exercise: Let $(m) \leq \mathbb{Z}$ where $m = \prod p_i^{k_i}$, and show that $\sqrt{(m)} = (p_1 p_2 \cdots) = \bigcap (p_i)$.

Proposition 1.16: If $\sqrt{\mathfrak{a}}$, $\sqrt{\mathfrak{b}}$ are coprime then \mathfrak{a} , \mathfrak{b} are coprime.

Exercise: Show that if $f: A \to B$ and $\mathfrak{a} \subseteq A$, it is not necessarily the case that $f(\mathfrak{a}) \subseteq B$.

Exercise: Show that if \mathfrak{b} is prime then $A \cdot f^{-1}(\mathfrak{b})$ is prime, but if \mathfrak{a} is prime then $B \cdot f(\mathfrak{a})$ need not be prime.

Exercise: Write $\mathfrak{a}^e := \langle f(\mathfrak{a}) \rangle$ and $\mathfrak{b}^c = \langle f^{-1}(\mathfrak{b}) \rangle$. Let $f : \mathbb{Z} \to \mathbb{Z}[i]$ be the inclusion, and show that

- $(2)^e = \langle (1+i)^2 \rangle$, which is not prime in $\mathbb{Z}[i]$
- (Nontrivial) If $p = 1 \mod 4$, then \mathfrak{p}^e is the product of two distinct prime ideals
- If $p = 3 \mod 4$ then \mathfrak{p}^e is prime.

Proposition: Let $C = \{ \mathfrak{b}^c \mid \mathfrak{b} \leq B \}$ and $E = \{ \mathfrak{a}^e \mid \mathfrak{a} \leq A \}$. Then

- 1. $\mathfrak{a} \subseteq \mathfrak{a}^{ec}$ and $\mathfrak{b} \supset \mathfrak{b}^{ce}$, 2. $\mathfrak{b}^c = \mathfrak{b}^{cec}$ and $\mathfrak{a}^e = \mathfrak{a}^{ece}$ 3. $C = \{\mathfrak{a} \leq A \mid \mathfrak{a}^{ec} = \mathfrak{a}\}$ and $E = \{\mathfrak{b} \leq B \mid \mathfrak{b}^{ce} = \mathfrak{b}\}$.
- 4. The map $\phi: C \to E$ given by $\phi(\mathfrak{a}) = \mathfrak{a}^{ec}$ is a bijection with inverse $\mathfrak{b} \mapsto \mathfrak{b}^c$.
- 5. If $\mathfrak{a} \in C$ then $\mathfrak{a} = \mathfrak{b}^c = \mathfrak{b}^{cec} = \mathfrak{a}^{ec}$, and if $\mathfrak{a} = \mathfrak{a}^{ec}$ then \mathfrak{a} is the contraction of \mathfrak{a}^e .

Exercise 1.18:

$$\begin{array}{ll} (\mathfrak{a}_1+\mathfrak{a}_2)^{\mathfrak{e}}=\mathfrak{a}_1^{\mathfrak{e}}+\mathfrak{a}_2^{\mathfrak{e}}, & (\mathfrak{b}_1+\mathfrak{b}_2)^c\geq \mathfrak{b}_1^{\mathfrak{e}}+\mathfrak{b}_2^{\mathfrak{e}}\\ (\mathfrak{a}_1\cap\mathfrak{a}_2)^e\subseteq \mathfrak{a}_1^{\mathfrak{e}}\cap \mathfrak{a}_2^e, & (\mathfrak{b}_1\cap\mathfrak{b}_2)^{\mathfrak{e}}=\mathfrak{b}_1^{\mathfrak{e}}\cap \mathfrak{b}_3^{\mathfrak{e}}\\ (\mathfrak{a}_1\mathfrak{a}_2)^{\mathfrak{e}}=\mathfrak{a}_1^{\mathfrak{e}}\mathfrak{a}_2^{\mathfrak{e}}, & (\mathfrak{b}_1\mathfrak{b}_2)^{\mathfrak{e}}\supseteq \mathfrak{b}_1^{\mathfrak{e}}\mathfrak{b}_2^{\mathfrak{e}}\\ (\mathfrak{a}_1:\mathfrak{a}_2)^{\mathfrak{e}}\subseteq (\mathfrak{a}_1^{\mathfrak{e}}:\mathfrak{a}_2^{\mathfrak{e}}), & (\mathfrak{b}_1:\mathfrak{b}_2)^{\mathfrak{e}}\subseteq (\mathfrak{b}_1^{\mathfrak{e}}:\mathfrak{b}_2^{\mathfrak{e}})\\ r(\mathfrak{a})^e\subseteq r(\mathfrak{a}^e), & r(\mathfrak{b})^e=r(\mathfrak{b}^e) \end{array}$$
