Zeta Functions

Fix q a prime and  $\mathbb{F} := \mathbb{F}_q$  the (unique) finite field with q elements, along with its (unique) degree n extensions

$$\mathbb{F}_{q^n} = \left\{ x \in \overline{\mathbb{F}}_q \mid x^{q^n} - x = 0 \right\} \quad \forall \ n \in \mathbb{Z}^{\geq 2}$$

## Definition (Zeta Function)

Let

$$J = \langle f_1, \cdots, f_M \rangle \subseteq k[x_0, \cdots, x_n]$$

be an ideal, then a *projective algebraic* variety  $X \subset \mathbb{P}^N_{\mathbb{F}}$  can be given by

$$X = V(J) = \left\{ x \in \mathbb{P}_{\mathbb{F}}^{\infty} \mid f_1(x) = \dots = f_M(x) = 0 \right\}$$

where an ideal generated by *homogeneous* polynomials in n+1 variables, i.e. there is some fixed  $d\in\mathbb{Z}^{\geq 1}$  such that

$$f(x) = \sum_{\substack{l = (i_1, \dots, i_n) \\ \sum_{i_1 = d}}} \alpha_1 \cdot x_0^{i_1} \cdots x_n^{i_n} \quad \text{and} \quad f(\lambda \cdot x) = \lambda^d f(x).$$
