- For X, Y topological spaces, consider $hom_{\top}(X, Y)$.
 - Topologize with the *compact-open* topology: $U \in \text{hom}_T(X, X)$ open iff for every $f \in U$, f(K) is open for every compact $K \subseteq X$.
 - * If Y = (Y, d) is a metric space, this is the topology of "uniform convergence on compact sets": for $f_n : X \to Y$, $f_n \to f$ in this topology iff

$$||f_n - f||_{\infty,K} := \sup \left\{ d(f_n(x), f(x)) \mid x \in K \right\} \stackrel{n \to \infty}{\to} 0.$$

Since these are homeomorphisms, everything is invertible, so equip with function composition to form a group.
