# **Contents**

0.1	Outline	1
0.2	Regular Points Are Open and Dense	4

#### 0.1 Outline

- Goal: Prove "injectivity" and continuation principle used in 8.5
- Prove Theorem 8.5.4
- Prove the continuation principle that was used in Proposition 8.1.4

#### Outline of statements:

- 8.1.5:  $(d\mathcal{F})_u$  is a Fredholm operator of index  $\mu(x) \mu(y)$ .
- 8.1.4:  $\Gamma: W^{1,p} \times C_{\varepsilon}^{\infty} \longrightarrow L^p$  has a continuous right-inverse and is surjective
- 8.1.3:  $\mathcal{Z}(x,y,J)$  is a Banach manifold
- 8.1.1: For  $h \in \mathcal{H}_{reg}$ ,  $H_0 + h$  is nondegenerate and  $(d\mathcal{F})_u$  is surjective for every  $u \in \mathcal{M}(H_0 + h, J)$ .

• 8.1.2: For  $h \in \mathcal{H}_{reg}$  and all contractible orbits x, y of  $H_0$ ,  $\mathcal{M}(x, y, H_0 + h)$  is a manifold of dimension  $\mu(x) - \mu(y)$ .

Set up notation:

• The Floer equation and its linearization:

$$\mathcal{F}(u) = \frac{\partial u}{\partial s} + J \frac{\partial u}{\partial t} + \operatorname{grad}_{u}(H) = 0$$
$$(d\mathcal{F})_{u}(Y) = \frac{\partial Y}{\partial s} + J_{0} \frac{\partial Y}{\partial t} + S \cdot Y, \quad Y \in u^{*}TW.$$

- z = s + it
- X is a vector field (time-dependent and periodic) on  $\mathbb{R}^{2n}$
- X, J are smooth
- *u* is a solution to the equation

$$\frac{\partial u}{\partial s} + J(t, u) \left( \frac{\partial u}{\partial t} - X(t, u) \right) = 0$$

• C(u) the set of critical points u, i.e

$$(s_0, t_0) \in C(u) \subseteq \mathbb{R} \times S^1 \iff \frac{\partial u}{\partial s}(s_0, t_0) = 0$$

• R(u) the set of regular points of u, i.e.

$$(s_0, t_0) \in R(u) \subset \mathbb{R} \times S^1 \iff (s_0, t_0) \notin C(u) \& s \neq s_0 \implies u(s_0, t_0) \neq u(s, t_0)$$

Goal: prove the following theorem

#### Theorem 0.1(8.5.4).

- 1. C(u) is discrete and
- 2.  $R(u) \hookrightarrow \mathbb{R} \times S^1$  is open and dense.
- Prove 8.6.1 (direct, short)
- Use 8.6.1 to produce a map v which reduces Theorem 8.5.4 to two statements
  - 8.6.2: The C(v) (and thus C(u)) is discrete
    - \* Proved later using similarity principle.
  - 8.6.3 (Injectivity): v a smooth periodic solution of CR with  $\frac{\partial v}{\partial s} \neq 0$  implies  $R(v) \hookrightarrow \mathbb{R}^2$  is open and dense.

Goal: prove a continuation principle:

#### Proposition 0.2(8.6.6, Continuation Principle).

On an open  $U \subset \mathbb{R}^2$ , let Y be a solution to the perturbed CR equation

$$\frac{\partial Y}{\partial s} + J_0 \frac{\partial Y}{\partial t} + S \cdot Y = 0$$

where  $J_0$  is the standard complex structure on  $\mathbb{R}^{2n}$  and  $S \in C^{\infty}(\mathbb{R}^2, \operatorname{End}(\mathbb{R}^{2n}))$ .

Contents 2

Say that f has an infinite-order zero at  $z_0$  iff

$$\forall k \ge 0, \quad \sup_{|z-z_0| \le t} \frac{|f(z)|}{r^k} \stackrel{r \longrightarrow 0}{\longrightarrow} 0.$$

For f smooth, equivalently  $f^{(k)}(z_0) = 0$  for all k.

Then the set

$$C \coloneqq \left\{ (s,t) \in U \ \middle| \ Y \text{ has an infinite order zero at } (s,t) \right\}$$

is clopen. In particular, if U is connected and Y=0 on some nonempty  $V\subset U$ , then  $Y\equiv 0$ .

#### Proposition 0.3(8.1.4,).

Define

$$\mathcal{Z}(x,y,J) := \{(u,H_0+h) | h \in \mathcal{C}_{\varepsilon}^{\infty}(H_0) \text{ and } u \in \mathcal{M}(x,y,J,H) \}.$$

If  $(u, H_0 + h) \in \mathcal{Z}(x, y)$  then the following map admits a continuous right-inverse and is surjective:

$$\Gamma: W^{1,p}\left(\mathbb{R} \times S^1; \mathbb{R}^{2n}\right) \times \mathcal{C}_{\varepsilon}^{\infty}\left(H_0\right) \longrightarrow L^p\left(\mathbb{R} \times S^1; \mathbb{R}^{2n}\right)$$
$$(Y,h) \longmapsto \left(d\mathcal{F}^{H_0+h}\right)_u(Y) + \operatorname{grad}_u h$$

where  $\mathcal{F}^{H_0+h}$  is the Floer operator corresponding to  $H_+h$ .

Used to show (via the implicit function theorem) that  $\mathcal{Z}(x,y,J)$  is a Banach manifold when  $x \neq y$ .

#### Proposition 0.4(8.6.1, Transform to CR-equation on R2).

If u is a solution to the following equation:

$$\frac{\partial u}{\partial s} + J(t,u) \left( \frac{\partial u}{\partial t} - X(t,u) \right) = 0.$$

Then there exist

- An almost complex structure J
- A diffeomorphism  $\phi$  on W?
- A map  $v \in C^{\infty}(\mathbb{R}^2; W)$

- satisfying  $\bullet \left( \frac{\partial}{\partial s} + J \frac{\partial}{\partial t} \right) v = 0$ 
  - $v(s,t+1) = \varphi(v(s,t))$
  - C(u) = C(v), i.e. u, v have the same critical points
  - R(u) = R(v).

Proof: short, include.

Lemma 8.6.2: The set of critical points of v above is discrete. Precisely: There exists a constant

Contents 3  $\delta > 0$  such that  $(dv)_z \neq 0$  for any  $0 << |z| < \delta$ .

Proof: Postponed to p.264.

Definition: Multiple points

Proposition 8.6.3: Injectivity result. Let v be a smooth 1-periodic (in t) solution of the CR equation, i.e.  $v(s,t+1) = \phi(v(s,t))$  for some smooth  $\phi$ ? and  $\frac{\partial v}{\partial s} \neq 0$ . Then  $R(v) \hookrightarrow \mathbb{R}^2$  is open and dense.

# 0.2 Regular Points Are Open and Dense

Proof (BIG):

- Show R(v) is open (easy)
- Show R(v) is dense (delicate)

Long proof.

Lemma 8.6.4: For every r > 0 there exists a  $\delta > 0$  such that

$$|t-t_0|$$
,  $|s-s_0| < \delta \implies \exists s' \in B_r(s_i) \text{ s.t. } v(s,t) = v(s',t)$ .

Proof: short.

Lemma 8.6.5: Let  $v_1, v_2$  be two solutions of the CR-equation with  $X_t \equiv 0$  on  $B_{\varepsilon}(0), v_1(0,0) = v_2(0,0)$  such that  $(dv_1)_0, (dv_2)_0 \neq 0$ . Also suppose

$$\forall \varepsilon \; \exists \delta \; \text{s.t.}$$

$$\forall (s,t) \in B_{\delta}(0), \exists s' \in \mathbb{R} \begin{cases} (s',t) \in B_{\varepsilon}(0) \\ v_1(s,t) = v_2(s',t) \end{cases}.$$

Then

$$\forall z \in B_{\varepsilon}(0), \quad v_1(s,t) = v_2(s,t).$$

Take perturbed CR equation:

$$\frac{\partial Y}{\partial s} + J_0 \frac{\partial Y}{\partial t} + S \cdot Y = 0.$$

Fix 
$$S \in C^{\infty}(\mathbb{R}^2; \operatorname{End}(\mathbb{R}^{2n}))$$

Lemma (Similarity Principle, used to prove continuation principle and 8.6.8): Let  $Y \in C^{\infty}(B_{\varepsilon}; \mathbb{C}^n)$  be a solution to the perturbed CR equation and let p > 2. Then there exists  $0 < \delta < \varepsilon$  and a map  $A \in W^{1,p}(B_{\delta}, \mathrm{GL}(\mathbb{R}^{2n}))$  and a holomorphic map  $\sigma : B_{\delta} \longrightarrow \mathbb{C}^n$  such that

$$\forall (s,t) \in B_{\delta} \quad Y(s,t) = A(s,t) \ \sigma(s+it) \quad \text{and} \quad J_0 A(s,t) = A(s,t) J_0.$$

Use continuation principle to finish proofs of many old theorems/lemmas.

Theorem (8.6.11, Essential property of  $\bar{\partial}$ ) For every p > 1, the following operator is surjective and Fredholm:

$$\bar{\partial}: W^{1,p}\left(S^2; \mathbb{C}^n\right) \longrightarrow L^p(\Lambda^{0,1}T^*S^2 \otimes \mathbb{C}^n).$$

Lead up to the proof of 8.1.5 in Section 8.7
