	1.1	Cyclic Groups	2	
		Homomorphisms		

# 1 Lecture 1 (Thu 15 Aug 2019)

Definition: A group is an ordered pair  $(G, \cdot : G \times G \to G)$  where G is a set and  $\cdot$  is a binary operation, which satisfies the following axioms:

- 1. Associativity:  $(g_1g_2)g_3 = g_1(g_2g_3)$
- 2. Identity:  $\exists e \in G \ni ge = eg = g$
- 3. Inverses:  $g \in G \implies \exists h \in G \ni gh = gh = e$ .

Some examples of groups:

- $\bullet$   $(\mathbb{Z},+)$
- $\bullet$   $(\mathbb{Q},+)$
- $(\mathbb{Q}^{\times}, \times)$
- $(\mathbb{R}^{\times}, \times)$
- $(GL(n, \mathbb{R}), \times) = \{A \in Mat_n \ni \det(A) \neq 0\}$
- $(S_n, \circ)$

Definition: A subset  $S \subseteq G$  is a *subgroup* of G iff

- 1.  $s_1, s_2 \in S \implies s_1 s_2 \in S$
- $2. \ e \in S$
- $3. \ s \in S \implies s^{-1} \in S$

We denote such a subgroup  $S \leq G$ .

Examples:

- $(\mathbb{Z},+) \leq (\mathbb{Q},+)$
- $SL(n, \mathbb{R}) \leq GL(n, \mathbb{R})$ , where  $SL(n, \mathbb{R}) = \{A \in GL(n, \mathbb{R}) \ni \det(A) = 1\}$

#### 1.1 Cyclic Groups

Definition: A group G is cyclic iff G is generated by a single element.

Exercise: Show  $\langle g \rangle = \{g^n \ni n \in \mathbb{Z}\} \cong \bigcap \{H \leq G \ni g \in H\}.$ 

Theorem: Let G be a cyclic group, so  $G\langle g \rangle$ .

- 1. If  $|G| = \infty$ , then  $G \cong \mathbb{Z}$ .
- 2. If  $|G| = n < \infty$ , then  $G \cong \mathbb{Z}_n$

Definition: Let  $H \leq G$ , and define a right coset of G by  $aH = \{ah \ni H \in H\}$ . A similar definition can be made for left cosets.

Then  $aH = bH \iff b^{-1}a \in G \text{ and } Ha = Hb \iff ab^{-1} \in H.$ 

Some facts:

- Cosets partition H, i.e.  $b \notin H \implies aH \cap bH = \{e\}$ .
- |H| = |aH| = |Ha| for all  $a \in G$ .

Theorem (Lagrange): If G is a finite group and  $H \leq G$ , then  $|H| \mid |G|$ .

Definition:  $N \leq G$  is normal iff gN = Ng for all  $g \in G$ , or equivalently  $gNg^{-1} \subseteq N$ . I denote this  $N \leq G$ .

When  $N \subseteq G$ , the set of left/right cosets of N themselves have a group structure. So we define  $G/N = \{gN \ni g \in G\}$  where  $(g_1N)(g_2N) = (g_1g_2)N$ .

Given  $H, K \leq G$ , define  $HK = \{hk \ni h \in H, k \in K\}$ . We have a general formula,

$$|HK| = \frac{|H||K|}{|H \cap K|}.$$

#### 1.2 Homomorphisms

Let G, G' be groups, then  $\varphi: G \to G'$  is a homomorphism if  $\varphi(ab) = \varphi(a)\varphi(b)$ .

Examples:

- $\exp: (\mathbb{R}, +) \to (\mathbb{R}^{>0}, \cdot)$  where  $\exp(a+b) = e^{a+b} = e^a e^b = \exp(a) \exp(b)$ .
- det:  $(GL(n,\mathbb{R}),\times) \to (\mathbb{R}^{\times},\times)$  where  $\det(AB) = \det(A)\det(B)$ .
- Let  $N \subseteq G$  and  $\varphi G \to G/N$  given by  $\varphi(g) = gN$ .
- Let  $\varphi : \mathbb{Z} \to \mathbb{Z}_n$  where  $\phi(g) = [g] = g \mod n$  where  $\mathbb{Z}_n \cong \mathbb{Z}/n\mathbb{Z}$

Definitions: Let  $\varphi: G \to G'$ . Then  $\varphi$  is a monomorphism iff it is injective, an epimorphism iff it is surjective, and an ismorphism iff it is bijective.
