#### 1.1 Frobenius Kernels

Let char (k)p > 0 and let G be an algebraic group scheme. We have a Frobenius map  $F: G \to G$  given by  $F((x_{ij})) = (x_{ij}^p)$ , which we can iterate to get  $F^r$  for  $r \in \mathbb{N}$ . Setting  $G_r = \ker F^r$  the rth Frobenius kernel, we get a normal series of group schemes

$$G_1 \trianglelefteq G_2 \trianglelefteq \cdots \trianglelefteq G$$
.

There is an associated chain of finite dimensional Hopf algebras

$$\operatorname{Dist}(G_1) \leq \operatorname{Dist}(G_2) \leq \cdots \leq \operatorname{Dist}(G).$$

Then  $k[G]^{\vee} = \operatorname{Dist}(G_r)$ , and we get an equivalence of representations for  $G_r$  to representations for  $\operatorname{Dist}(G_r)$ .

A special case will be when G is a reductive algebraic group scheme. We'll start by finding a basis for  $Dist(G_r)$ .

Recall the PBW theorem: we have a basis for  $\mathfrak g$  given by

$$\left\{ x_{\alpha} \mid \alpha \in \Phi^{+} \right\}$$
 Positive root vectors  $\left\{ h_{i} \mid i = 1, \cdots, n \right\}$  A basis for  $t$   $\left\{ x_{\alpha} \mid \alpha \in \Phi^{-} \right\}$  Negative root vectors

1

We can then obtain a basis for  $U(\mathfrak{g})$ :

$$U(\mathfrak{g}) = \left\langle \prod_{\alpha \in \Phi^+} x_{\alpha}^{n(\alpha)} \prod_{i=1}^n h_i^{k_i} \prod_{\alpha \in \Phi^+} x_{-\alpha}^{m(\alpha)} \right\rangle.$$

We can similarly obtain a basis for the distribution algebra

$$\operatorname{Dist}(G) = \left\langle \prod_{\alpha \in \Phi^+} \frac{x_{\alpha}^{n(\alpha)}}{n!} \prod_{i=1}^{n} \binom{h_i}{k_i} \prod_{\alpha \in \Phi^+} \frac{x_{-\alpha}^{n(\alpha)}}{n!} \right\rangle,$$

and we can similar get  $\mathrm{Dist}(G_r)$  by restricting to  $0 \leq n(\alpha), k_i, m(\alpha) \leq p^r - 1$ . Above the  $k_i$  are allowed to be any integers. This yields a triangular decomposition

$$\operatorname{Dist}(G_r) = \operatorname{Dist}(U_r^+)\operatorname{Dist}(T_r)\operatorname{Dist}(U_r^-),$$

where we'll denote the first two terms  $Dist(B_r^+)$  and the last two as  $Dist(B_r)$ .

#### 1.2 Induced and Coinduced Modules

Goal: Classify simple  $G_r$ -modules. We know the classification of simple G-modules, so we'll follow similar reasoning. We started by realizing  $L(\lambda) \hookrightarrow \operatorname{Ind}_B^G \lambda$  as a submodule (the socle) of some "universal" module.

Let M be a  $B_r$ -module, we can then define

$$\operatorname{Ind}_{B_{-}}^{G_{r}} M = (k[G_{r}] \otimes M)^{B_{r}},$$

where we're now taking the  $B_r$ -invariants. We get a decomposition as vector spaces,

$$k[G_r] = k[U_r^+] \otimes_k k[B_r]$$

and thus an isomorphism

$$\operatorname{Ind}_{B_r}^{G_r} M = (k[G_r] \otimes M)^{B_r} \cong k[U_r^+] \otimes (k[B_r] \otimes M)^{B_r} \cong k[U_r^+] \otimes M$$

since  $k[B_r] \otimes M \cong \operatorname{Ind}_{B_r}^{B_r} M \cong M$ .

We then define

$$\operatorname{Coind}_{B_r}^{G_r} = \operatorname{Dist}(G_r) \otimes_{\operatorname{Dist}(B_r)} \otimes M,$$

which is an analog of  $U(\mathfrak{g}) \otimes_{U(\mathfrak{b})} M$ .

We have  $\operatorname{Dist}(U_r^+) \otimes \operatorname{Dist}(B_r) \cong \operatorname{Dist}(G_r)$ , so

$$\operatorname{Coind}_{B_r}^{G_r} = \operatorname{Dist}(G_r) \otimes_{\operatorname{Dist}(B_r)} \otimes M \cong \operatorname{Dist}(U_r^+) \otimes_k \operatorname{Dist}(B_r) \otimes_{\operatorname{Dist}(B_r)} M \cong \operatorname{Dist}(U_r^+) \otimes_k M,$$

which we'll define as the coinduced module.

We can compute the dimension:

$$\dim \operatorname{Ind}_{B_r}^{G_r} M = \dim \operatorname{Coind}_{B_r}^{G_r} M = (\dim M) p^{r|\Phi^+|}.$$

Open: don't know how to compute composition factors.

### Proposition 1.1(?).

1.

$$\operatorname{Coind}_{B_r}^{G_r} M \equiv \operatorname{Ind}_{B_r}^{G_r} M \otimes 2(p^r - 1)\rho,$$

where the last term is a one-dimensional  $B_r$ -module and  $\rho$  is the Weyl weight.

2.

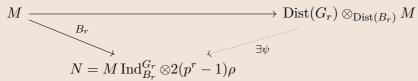

$$\operatorname{Coind}_{B_r^+}^{G_r} M \cong \operatorname{Ind}_{B_r^+}^{G_r} M \otimes -2(p^r-1)\rho$$

where

$$\rho = \frac{1}{2} \sum_{\alpha \in \Phi^+} \alpha = \sum_{i=1}^n w_i.$$

Proof (Sketch for (1)).

Since the tensor product satisfies a universal property, we have a map

- 1. We need to find a  $B_r$  morphism  $f: M \to N$ .
- 2. We need to show that f generates N as a  $G_r$ -module.

Note that if (1) and (2) hold, then  $\psi$  is surjective, but since dim Coind $_{B_r}^{G_r}M=\dim N$  this forces  $\psi$  to be an isomorphism.

We can write

$$\operatorname{Ind}_{B_r}^{G_r} M \otimes 2(p^r - 1)\rho = (k[G_r] \otimes M \otimes 2(p^r - 1)\rho)^{B_r}$$
  

$$\cong \operatorname{hom}_{B_r} (\operatorname{Dist}(G_r), M \otimes 2(p^r - 1)\rho).$$

Let  $g_m(x) := m \otimes 2(p^r - 1)\rho$  for any  $x = \prod_{\alpha \in \Phi^+} \frac{x_{\alpha}^{p^r - 1}}{(p^r - 1)!}$ , and  $g_m(x) = 0$  for any other x.

Now define  $f(m) = g_m$ , and check that im f generates N.

#### 1.3 Verma Modules

Recall that  $W(\lambda) := U(\mathfrak{g}) \otimes_{U(\mathfrak{b}^+)} \lambda$  were the Verma modules for lie algebras.

Let  $\lambda \in X(T)$ , we have  $T_r \leq T$  and restriction yields a map  $X(T) \to X(T_r)$ . Given a weight  $\lambda$ , we can write it p-adically as

$$\lambda = \lambda_0 + \lambda_1 p + \lambda_2 p^2 + \dots + \lambda_{r-1} + \dots$$

This yields an exact sequence

$$0 \to p^r X(T) \to X(T) \to X(T_r) \to 0$$

and thus  $X(T)/p^rX(T) \cong X(T_r)$ .

Let  $\lambda \in X(T_r)$ , then  $\lambda$  becomes a  $B_r$ -module by letting  $U_r$  act trivially, since we have

$$\cdots U_r \to B_r \twoheadrightarrow T_r \to 0.$$

Set  $Z(r) = \operatorname{Coind}_{B_r}^{G_r} \lambda$ , and set  $Z(r)' = \operatorname{Ind}_{B_r}^{G_r} \lambda$ . Then  $\dim Z_r(\lambda) = \dim Z'_r(\lambda) = p^{r|\Phi^+|}$ . We'll then think of

- Coind  $\rightarrow L_r(\lambda)$  being in the head,
- $L_r(\lambda) \hookrightarrow \text{Ind being the socle.}$

Note that the dimensions aren't known, nor are the projective covers or injective hulls.

We have a form of translation invariance, namely

$$Z_r(\lambda + p^r \nu) = Z_r(\lambda) \qquad \forall \nu \in X(T)$$
  
 $Z'_r(\lambda + p^r \nu) = Z'_r(\lambda) \qquad \forall \nu \in X(T).$ 

## Proposition 1.2(?).

Let  $\lambda \in X(T)$ .

- 1.  $Z_r(\lambda)\downarrow_{B_r}$  is the projective cover of  $\lambda$  and the injective hull of  $\lambda 2(p^r 1)\rho$ .
- 2.  $Z'_r(\lambda)\downarrow_{B_r^+}$  is the injective hull of  $\lambda$  and the projective hull of  $\lambda 2(p^r 1)\rho$ .
