Let  $k = \bar{k}$  and R a ring containing ideals I, J.

Definition 1.0.1 (Radical).

Recall that the radical of I is defined as

$$\sqrt{I} = \left\{ r \in R \ \middle| \ r^k \in I \text{ for some } k \in \mathbb{N} \right\}.$$

### Example 1.1.

Let  $I = (x_1, x_2^2) \subset \mathbb{C}[x_1, x_2]$ , so  $I = \{f_1x_1 + f_2x_2 \mid f_1, f_2 \in \mathbb{C}[x_1, x_2]\}$ . Then  $\sqrt{I} = (x_1, x_2)$ , since  $x_2^2 \in I \implies x_2 \in \sqrt{I}.$ 

Given  $f \in k[x_1, \dots, x_n]$ , take its value at  $a = (a_1, \dots, a_n)$  and denote it f(a). Set  $\deg(f)$  to be the largest value of  $i_1 + \cdots + i_n$  such that the coefficient of  $\prod x_i^{i_j}$  is nonzero.

Example 1.2.  $deg(x_1 + x_2^2 + x_1 x_2^3 = 4)$ 

#### **Definition 1.0.2** (Affine Variety).

1. Affine *n*-space  $\mathbb{A}^n = \mathbb{A}^n_k$  is defined as  $\{(a_1, \dots, a_n) \mid a_i \in k\}$ .

Remark: not  $k^n$ , since we won't necessarily use the vector space structure (e.g. adding

2. Let  $S \subset k[x_1, \dots, x_n]$  to be a set of polynomials.  $\{x \in \mathbb{A}^n \mid f(x) = 0\} \subset \mathbb{A}^n$  to be an affine variety. Then define V(S)

#### Example 1.3.

- $\mathbb{A}^n = V(0)$ .
- For any point  $(a_1, \dots, a_n) \in \mathbb{A}^n$ , then  $V(x_1 a_1, \dots, x_n a_n) = \{a_1, \dots, a_n\}$  uniquely determines the point.
- For any finite set  $r_1, \dots, r_k \in \mathbb{A}^1$ , there exists a polynomial f(x) whose roots are  $r_i$ .

#### Remark 1.

We may as well assume S is an ideal by taking the ideal it generates,  $S \subseteq \langle S \rangle = \{ \sum g_i f_i \mid g_i \in k[x_1, \cdots, x_n], f_i \in S \}$ . Then  $V(\langle S \rangle) \subset V(S)$ .

Conversely, if  $f_1, f_2$  vanish at  $x \in \mathbb{A}^n$ , then  $f_1 + f_2, gf_1$  also vanish at x for all  $g \in k[x_1, \dots, x_n]$ . Thus  $V(S) \subset V(\langle S \rangle)$ .

#### Lemma 1.1.

- 1. If  $S_1 \subseteq S_2$  then  $V(S_1) \subseteq V(S_2)$ . 2.  $V(S_1 \bigcup S_2) = V(S_1S_2) = V(S_1) \bigcap V(S_2)$ .

We thus have a map

$$V: \{ \text{Ideals in } k[x_1, \cdots, x_n] \} \longrightarrow \{ \text{Affine varieties in } \mathbb{A}^n \}.$$

## **Definition 1.1.1** (The Ideal of a Set).

Let  $X \subset \mathbb{A}^n$  be any set, then the ideal of X is defined as

$$I(X) := \left\{ f \in k[x_1, \cdots, x_n] \mid f(x) = 0 \,\forall x \in X \right\}.$$

#### Example 1.4.

Let X be the union of the  $x_1$  and  $x_2$  axes in  $\mathbb{A}^2$ , then  $I(X) = (x_1x_2) = \{x_1x_2g \mid g \in k[x_1, x_2]\}.$ 

Note that if  $X_1 \subset X_2$  then  $I(X_1) \subset I(X_2)$ .

### Proposition 1.2(The Image of V is Radical).

I(X) is a radical ideal, i.e.  $I(X) = \sqrt{I(X)}$ .

This is because  $f(x)^k = 0 \forall x \in X$  implies f(x) = 0 for all  $x \in X$ , so  $f^k \in I(X)$  and thus  $f \in I(X)$ .

Our correspondence is thus

$$\left\{ \text{Ideals in } k[x_1, \cdots, x_n] \right\} \xrightarrow{V} \left\{ \text{Affine Varieties} \right\}$$

$$\left\{ \text{Radical Ideals} \right\} \xleftarrow{I} \left\{ ? \right\}.$$

## Proposition 1.3(Hillbert Nullstellensatz (Zero Locus Theorem)).

- a. For any affine variety X, V(I(X)) = X.
- b. For any ideal  $J \subset k[x_1, \cdots, x_n]$ ,  $I(V(J)) = \sqrt{J}$ .
