Prologue

 $\bullet \ \ Gathmann's \ Algebraic \ Geometry \ notes [@Andreas Gathmann 515].$

0.1 References 3

• If a property P is said to hold **locally**, this means that for every point p there is a neighborhood $U_p \ni p$ such that P holds on U_p .

$U_p \ni p$ such that P holds of	n U_p .
$k[\mathbf{x}] \coloneqq k[x_1, \cdots, x_n]$	The polynomial ring in n indeterminates
$k(\mathbf{x}) \coloneqq k(x_1, \cdots, x_n)$	The rational function field
$\mathcal{U} ightrightarrows X$	An open cover
Δ_X	The diagonal $\{(x,x) \mid x \in X\} \subseteq X \times X$
$\mathbb{A}^n_{/k}$	Affine n -space
	$\mathbb{A}^n_{/k} \coloneqq \left\{ [k_1, \cdots, k_n] \mid k_j \in k \right\}$
$\mathbb{P}^n_{/k}$	Projective n-space
,	$\mathbb{P}^n_{/k} := \left(k^n \setminus \{0\}\right)/x \sim \lambda x$
	$\{f(\mathbf{x}) = p(\mathbf{x})/q(\mathbf{x}), \mid p, q, \in k[x_1, \cdots, x_n]\}$
$V(J), V_a(J)$	Variety associated to an ideal $J \leq k[x_1, \dots, x_n]$
	$\coloneqq \left\{ \mathbf{x} \in \mathbb{A}^n \;\middle \; f(\mathbf{x}) = 0, orall f \in J ight\}$
$I(S), I_a(S)$	Ideal associated to a subset $S \subseteq \mathbb{A}^n_k$
	$:= \left\{ f \in k[x_1, \cdots, x_n] \mid f(\mathbf{x}) = 0 \forall \mathbf{x} \in X \right\}$
A(X)	Coordinate ring of a variety
$V_p(J)$	Projective variety of an ideal
	$\coloneqq \left\{ \mathbf{x} \in \mathbb{P}^n_{/k} \mid f(\mathbf{x}) = 0, \forall f \in J \right\}$
$I_p(S)$	Projective ideal?
	$:= \left\{ f \in k[x_1, \cdots, x_n] \mid f \text{ is homogeneous and } f(x) = 0 \forall x \in S \right\}$
S(X)	Projective coordinate ring
	$:= k[x_1, \cdots, x_n]/I_p(X)$
f^h	Homogenization
	$\coloneqq x_0^{\deg f} f\left(\frac{x_1}{x_0}, \cdots, \frac{x_n}{x_0}\right)$
f^i	Dehomogenization
J^h for $J \leq k[x_1, \cdots, x_n]$	Homogenization of an ideal
	$\coloneqq f(1, x_1, \cdots, x_n)$
\overline{X}	Projective closure of a subset
	$\coloneqq V_p(J^h) \coloneqq \left\{ \mathbf{x} \in \mathbb{P}^n \mid f^h(\mathbf{x}) = 0 \forall f \in X \right\}$
	$:= k[x_1, \cdots, x_n]/I(X)$
\mathcal{O}_X	Structure sheaf $\{f: U \to k \mid f \in k(\mathbf{x}) \text{ locally}\}$
D(f)	Distinguished open set
	$:= V(f)^c = \left\{ x \in \mathbb{A}^n \mid f(x) \neq 0 \right\}$

0.2 Notation · 4

Lots of notation to fill in.

Algebra	Geometry
Radical ideals $J = \sqrt{J} \le k[x_1, \cdots, x_n]$	V(J) the zero locus
I(S) the ideal of a set	$S \subseteq \mathbb{A}^n$ a subset
I + J	$V(I) \cap V(J)$
$\sqrt{I(V) + I(W)}$	$V \cap W$
$\dot{I}\cap J, IJ$	$V(I) \cup V(J)$
$I(V) \cap I(W), \sqrt{I(V)I(W)}$	$V \cup W$
I(V):I(W)	$\overline{V\setminus W}$
Prime ideals $\mathfrak{p} \in \operatorname{Spec}(k[x_1, \cdots, x_n])$	Irreducible subsets

0.3 Summary of Important Concepts

- What is an affine variety?
- What is the coordinate ring of an affine variety?
- What are the constructions $V(\cdot)$ and $I(\cdot)$?
- What is the Nullstellensatz?
- What are the definitions and some examples of:
 - The Zariski topology?
 - Irreducibility?
 - Connectedness?
 - Dimension?
- What is the definition of a presheaf?
 - What are some examples and counterexamples?
- What is the definition of sheaf?
 - What are some examples?
 - What are some presheaves that are not sheaves?
- What is the definition of \mathcal{O}_X , the sheaf of regular functions?
 - How does one compute \mathcal{O}_X for X = D(f) a distinguished open?
- What is a morphism between two affine varieties?
- What is the definition of separatedness?
 - What are some examples of spaces that are and are not separated?
- What is a projective space?
- What is a projective variety?
- What is the projective coordinate ring?
- How does one take the closure of an affine variety X in projective space?
- What is completeness?
 - What are some examples and counterexamples of complete spaces?

0.4 Useful Examples

- $V(xy-1) \subseteq \mathbb{A}^2$ a hyperbola
- V(x) a coordinate axis
- V(x-p) a point.

0.4.2 Presheaves / Sheaves

- $C^{\infty}(\cdot,\mathbb{R})$, a sheaf of smooth functions
- $C^0(\cdot,\mathbb{R})$, a sheaf of continuous functions
- $\mathcal{O}_X(\cdot)$, the sheaf of regular functions on X
- $\mathbb{R}(\cdot)$, the constant sheaf associated to \mathbb{R} (locally constant real-valued functions)
- $\operatorname{Hol}(\cdot,\mathbb{C})$, a sheaf of holomorphic functions
- K_p the skyscraper sheaf:

$$K_p(U) := \begin{cases} k & p \in U \\ 0 & \text{else.} \end{cases}$$

0.5 Useful Algebra Facts

Fact 0.5.1:

- $\mathfrak{p} \leq R$ is prime $\iff R/\mathfrak{p}$ is a domain.
- $\mathfrak{p} \leq R$ is maximal $\iff R/\mathfrak{p}$ is a field.
- Maximal ideals are prime.
- Prime ideals are radical.
- If R is a PID and $\langle f \rangle \leq R$ is generated by an irreducible element f, then $\langle f \rangle$ is maximal

Proposition 0.5.2 (Finitely generated polynomial rings are Noetherian).

A polynomial ring $k[x_1, \dots, x_n]$ on finitely many generators is Noetherian. In particular, every ideal $I \subseteq k[x_1, \dots, x_n]$ has a finite set of generators and can be written as $I = \langle f_1, \dots, f_m \rangle$.

Proof(?).

A field k is both Artinian and Noetherian, since it has only two ideals and thus any chain of ideals necessarily terminates. By Hilbert's basis theorem (Theorem 0.5.5), $k[x_1, \dots, x_n]$ is thus Noetherian.

0.4 Useful Examples 6

Proposition 0.5.3 (Properties and Definitions of Ideal Operations).

$$\begin{split} I+J &\coloneqq \left\{f+g \;\middle|\; f \in I, \, g \in J\right\} \\ IJ &\coloneqq \left\{\sum_{i=1}^N f_i g_i \;\middle|\; f_i \in I, \, g_i \in J, N \in \mathbb{N}\right\} \\ I+J &= \langle 1 \rangle \implies I \cap J = IJ & \text{(coprime or comaximal)} \; \langle a \rangle + \langle b \rangle = \langle a,b \rangle \,. \end{split}$$

Theorem 0.5.4 (Noether Normalization).

Any finitely-generated field extension $k_1 \hookrightarrow k_2$ is a finite extension of a purely transcendental extension, i.e. there exist t_1, \dots, t_ℓ such that k_2 is finite over $k_1(t_1, \dots, t_\ell)$.

Theorem 0.5.5 (Hilbert's Basis Theorem).

If R is a Noetherian ring, then R[x] is again Noetherian.

0.6 The Algebra-Geometry Dictionary

 \sim

Let $k = \bar{k}$, we're setting up correspondences

Ring Theory Geometry/Topology of Affine Varieties Polynomial functions Affine space $k[x_1,\cdots,x_n] \qquad \mathbb{A}^n/k \coloneqq \{[a_1,\cdots,a_n] \in k^n\}$

Maximal ideals $\langle x_1 - a_1, \cdots, x_n - a_n \rangle$ Points $[a_1, \cdots, a_n] \in \mathbb{A}^n/k$

Radical ideals $I \leq k[x_1, \dots, x_n]$ Affine varieties $X \subset \mathbb{A}^n/k$, vanishing locii of polynomia

$$I \mapsto V(I) \coloneqq \left\{ a \mid f(a) = 0 \forall f \in I \right\}$$

$$I(X) \coloneqq \left\{ f \;\middle|\; f|_X = 0 \right\} \hookleftarrow X$$

Radical ideals containing I(X), i.e. ideals in A(X) closed subsets of X, i.e. affine subvarieties

A(X) is a domain X irreducible A(X) is not a direct sum X connected

Prime ideals in A(X) Irreducible closed subsets of X

Krull dimension n (longest chain of prime ideals) dim X = n, (longest chain of irreducible closed subsets
