#### 0.1 Outline

Two Goals:

- 1. Prove critical points are discrete and regular points are open/dense.
- 2. Prove the continuation principle that was used in Proposition 8.1.4
- 3. Idea: A holomorphic function with all derivatives vanishing on a line is identically zero on C

#### 0.2 Outline of Statements

- 8.1.5:  $(d\mathcal{F})_u$  is a Fredholm operator of index  $\mu(x) \mu(y)$ . 8.1.4:  $\Gamma: W^{1,p} \times C_{\varepsilon}^{\infty} \longrightarrow L^p$  has a continuous right-inverse and is surjective
- 8.1.3:  $\mathcal{Z}(x,y,J)$  is a Banach manifold
- 8.1.1: For  $h \in \mathcal{H}_{reg}$ ,  $H_0 + h$  is nondegenerate and  $(d\mathcal{F})_u$  is surjective for every  $u \in \mathcal{M}(H_0 + h, J)$ .

• 8.1.2: For  $h \in \mathcal{H}_{reg}$  and all contractible orbits x, y of  $H_0$ ,  $\mathcal{M}(x, y, H_0 + h)$  is a manifold of dimension  $\mu(x) - \mu(y)$ .

# 0.3 Notation

• The Floer equation and its linearization:

$$\mathcal{F}(u) = \frac{\partial u}{\partial s} + J \frac{\partial u}{\partial t} + \operatorname{grad} u(H) = 0$$
$$(d\mathcal{F})_u(Y) = \frac{\partial Y}{\partial s} + J_0 \frac{\partial Y}{\partial t} + S \cdot Y$$
$$Y \in u^* TW, \ S \in C^{\infty}(\mathbb{R} \times S^1; \operatorname{End}(\mathbb{R}^{2n})).$$

- $\bullet$  z = s + it
- X is a vector field (time-dependent and periodic) on  $\mathbb{R}^{2n}$ , J an almost complex structure -X,J are smooth
- $u \in C^{\infty}(\mathbb{R} \times S^1; W)$  is a solution to the equation

$$\frac{\partial u}{\partial s} + J(t, u) \left( \frac{\partial u}{\partial t} - X(t, u) \right) = 0$$

• C(u) the set of critical points and R(u) the set of regular points of u:

$$(s_0, t_0) \in C(u) \subseteq \mathbb{R} \times S^1 \iff \frac{\partial u}{\partial s}(s_0, t_0) = 0$$
  
$$(s_0, t_0) \in R(u) \subset \mathbb{R} \times S^1 \iff (s_0, t_0) \notin C(u) \& s \neq s_0 \implies u(s_0, t_0) \neq u(s, t_0).$$

## 0.4 Goal 1: Discrete Critical Points and Dense Regular Points

Goal 1: prove the following theorem

#### Theorem 0.1(8.5.4).

- 1. C(u) is discrete and
- 2.  $R(u) \hookrightarrow \mathbb{R} \times S^1$  is open and dense.

Outline of the proof:

• Prove 8.6.1 (direct, short) which transforms the equation

$$\frac{\partial u}{\partial s} + J(t, u) \left( \frac{\partial u}{\partial t} - X(t, u) \right) = 0 \quad \text{where} \quad u \in C^{\infty}(\mathbb{R} \times S^1; W)$$

to a Cauchy-Riemann equation on  $\mathbb{R}^2$ :

$$\frac{\partial v}{\partial s} + J \frac{\partial v}{\partial t} = 0$$
 where  $v \in C^{\infty}(\mathbb{R}^2; W)$ 

- Produces a map v which reduces Theorem 8.5.4 to two statements
  - 8.6.2: C(v) (and thus C(u)) is discrete
    - \* Proved later using similarity principle.

- 8.6.3 (Injectivity): If v is a smooth periodic solution of CR with  $\frac{\partial v}{\partial s} \neq 0$  then  $R(v) \hookrightarrow \mathbb{R}^2$ is open and dense.
- Prove 8.6.3 (Injectivity)
  - Show open.
  - Show dense
- Prove 8.6.8 (similarity principle)
- Use similarity principle to prove 8.6.1, yields theorem.

#### 0.5 8.6.1: Transform to Cauchy-Riemann

Proposition 0.2(8.6.1, Transform to CR-equation on R2).

If u is a solution to the following equation:

$$\frac{\partial u}{\partial s} + J(t, u) \left( \frac{\partial u}{\partial t} - X(t, u) \right) = 0.$$

Then there exists

- An almost complex structure  $J_1$
- A diffeomorphism  $\varphi$  on W? A map  $v \in C^{\infty}(\mathbb{R}^2; W)$

satisfying

$$\frac{\partial v}{\partial s} + J_1(v)\frac{\partial v}{\partial t} = 0$$

where

- 1.  $v(s, t+1) = \varphi(v(s, t))$
- 2. C(u) = C(v), i.e. u, v have the same critical points
- 3. R(u) = R(v).

#### Proof

- Since  $W \times S^1$  is compact, the flow  $\psi_t$  of  $X_t$  is defined on all of W
  - We thus have a map  $\psi_t: W \longrightarrow W$  such that

$$\frac{\partial}{\partial t}\psi_t = X_t \circ \psi_t, \qquad \psi_0 = \mathrm{id}$$

• Define the (important!) map

$$v(s,t) \coloneqq \left(\psi_t^{-1} \circ u\right)(s,t)$$

• We can then compute

$$\begin{aligned} \frac{\partial u}{\partial s} &= (d\psi_t) \left( \frac{\partial v}{\partial s} \right) \\ \frac{\partial u}{\partial t} &= (d\psi_t) \left( \frac{\partial v}{\partial t} \right) + X_t(u). \end{aligned}$$

- Attempt at explanation: rearrange, use chain rule, and known derivative of  $\psi_t$ :

$$u(s,t) = (\psi_t \circ v)(s,t) \implies \frac{\partial u}{\partial s}(s,t) = \frac{\partial \psi_t}{\partial s}(v(s,t)) \cdot \frac{\partial v}{\partial s}(s,t)$$

$$? \implies \frac{\partial u}{\partial s} = (d\psi_t) \cdot \left(\frac{\partial v}{\partial s}\right)$$

and

$$\frac{\partial u}{\partial t}(s,t) = \frac{\partial \psi_t}{\partial t}(v(s,t)) \cdot \frac{\partial v}{\partial t}(s,t) 
= (X_t \circ \psi_t)(v(s,t)) \cdot \frac{\partial v}{\partial t}(s,t) 
= (X_t \circ \psi_t \circ v)(s,t) \cdot \frac{\partial v}{\partial t}(s,t) 
= X_t(u(s,t)) \cdot \frac{\partial v}{\partial t}(s,t) 
= X_t(u) \left(\frac{\partial v}{\partial t}\right) \cdots ?????.$$

• Continuing computations,

$$0 = \frac{\partial u}{\partial s} + J\left(\frac{\partial u}{\partial t} - X_t(u)\right) \qquad \text{since } u \text{ is a solution}$$

$$= \frac{\partial u}{\partial s} + J\frac{\partial u}{\partial t} - JX_t(u) \qquad \text{expanding terms}$$

$$= \left(\left(\frac{\partial v}{\partial s}\right)\right) + J\left(\left(\frac{\partial v}{\partial t}\right) + X_t(u)\right) - JX_t(u) \qquad \text{by substitution}$$

$$= \left(\frac{\partial v}{\partial s}\right) + J(u)\left(\frac{\partial v}{\partial t}\right) + X_t(u) - JX_t(u) \qquad \text{cancelling}$$

$$= \left(\frac{\partial v}{\partial s}\right) + J(u)\left(\frac{\partial v}{\partial t}\right) \qquad \text{collecting terms}$$

$$= \left(\frac{\partial v}{\partial t}\right) \left(\frac{\partial v}{\partial s} + \left(\frac{\partial v}{\partial s}\right) + J(u)\left(\frac{\partial v}{\partial t}\right)\right) \qquad \text{by definition.}$$

 $\bullet$  Conclude that v is a solution of

$$\frac{\partial v}{\partial s} + \psi_t^{\star} J(v) \frac{\partial v}{\partial t} = 0.$$

• Set  $\varphi := \psi_1$  and  $J_1(v) := \psi_1^* J(v)$  to obtain

$$\frac{\partial v}{\partial s} + J_1(v) \frac{\partial v}{\partial t} = 0$$

of which v is still a solution

• Attempt to check directly, using  $\psi_{t+1} = \psi_t \circ \psi_1$ :

$$v(s, t+1) \coloneqq (\psi_t^{-1} \circ u)(s, t+1)$$

$$? = (\psi_1 \circ \psi_t^{-1} \circ u)(s, t)$$

$$= \psi_1(v(s, t))$$

$$\coloneqq \varphi(v(s, t)),$$

which verifies property 1.

Note: just a guess from me!

• Recall definition of v:

$$v(s,t) \coloneqq \psi_t^{-1}(u(s,t))$$

- Verifying that C(v) = C(u): not spelled out. Property of flow?
  - Need to check that

$$\frac{\partial u}{\partial s}(s_0, t_0) = 0 \implies \frac{\partial v}{\partial s}(s_0, t_0) = 0$$

where

$$\frac{\partial u}{\partial s} = (d\psi_t) \left(\frac{\partial v}{\partial s}\right)$$

- How: ?

- Verifying that R(v) = R(u)
  - Need to check that for  $(s_0, t_0) \notin C(u)$  and  $s \neq s_0$  we have

$$u(s_0, t_0) \neq u(s, t_0) \implies v(s_0, t_0) \neq v(s, t_0)$$

- Follows directly:

$$v(s_0, t_0) \neq v(s, t_0) \iff \psi_t^{-1}(u(s_0, t_0)) \neq \psi_t^{-1}(u(s, t_0))$$
 by definition 
$$\iff \left(\psi_t \circ \psi_t^{-1}\right)(u(s_0, t_0)) \neq \left(\psi_t \circ \psi_t^{-1}\right)(u(s, t_0)) \text{ injectivity of } \psi_t$$
 
$$\iff u(s_0, t_0) \neq u(s, t_0).$$

#### 0.6 Splitting the Main Theorem

• The main theorem is equivalent to two upcoming statements

Proposition 0.3(8.6.2: Statement 1, Critical Points are Discrete).

Let z = s + it where  $(s, t) \in \mathbb{R}^1 \times S^1$  (?). There exists a constant  $\delta > 0$  such that

$$0 < |z| < \delta \implies (dv)_z \neq 0.$$

Proof.

Postponed to p.264 because it relies on the 8.6.8 (Similarity Principle).

For the second statement, we set up some notation/definitions.

•  $v \in C^{\infty}(\mathbb{R}^2; W)$  is a solution satisfying

$$\frac{\partial v}{\partial s} + J_1(v)\frac{\partial v}{\partial t} = 0$$

$$v(s, t+1) = \varphi(v(s, t))$$

$$C(v) = C(u), R(v) = R(u).$$

• The **regular points** are given by

$$R(v) = \left\{ (s,t) \in \mathbb{R}^2 \mid \frac{\partial v}{\partial s}(s,t) \neq 0, \quad v(s,t) \neq x^{\pm}(t), \quad v(s,t) \notin v(\mathbb{R} \setminus \{s\}, t) \right\}.$$

Note: last condition should be equivalent to  $s \neq s' \implies v(s,t) \neq v(s',t)$ .

- Multiple points are defined as follows:
  - $\text{ Set } \overline{\mathbb{R}} = \mathbb{R} \coprod \{ \pm \infty \}$  $\text{ Extend } v : \mathbb{R}^2 \longrightarrow W \text{ to}$

$$v: \overline{\mathbb{R}} \times \mathbb{R} \longrightarrow W$$
  
 $v(\pm \infty, t) = x^{\pm}(t).$ 

$$v(\pm \infty, \iota) = x$$
 (

- Define the set of multiple points as

$$M(s,t) := \left\{ (s',t) \in \mathbb{R}^2 \ \middle| \ s \neq s' \in \overline{\mathbb{R}}, \quad v(s',t) = v(s,t) \right\}$$

Note that the same t is used throughout.

- Recast definition of R(v) as "points in the complement of C(v) that do not admit multiples".
  - Potentially incorrect formulation:

$$R(v) = C(v)^c \bigcap_{(s,t) \in \overline{\mathbb{R}} \times \mathbb{R}} M(s,t)^c.$$

Proposition 0.4(8.6.3: Regular Points Open/Dense, "Injectivity").

Let v be a smooth solution of the Cauchy-Riemann equation, then

$$v(s,t+1) = \varphi(v(s,t))$$
  $\Longrightarrow R(v) \subseteq \mathbb{R}^2$  is open and dense.

Proof (Long).

Splits into two parts:

- Show R(v) is open (easy)
- Show R(v) is dense (delicate)

## 0.7 Regular Points Are Open

Proving the first part: R(v) is open.

- Want to show  $R(v)^c$  is closed.
- Toward a contradiction, suppose otherwise:  $R(v)^c$  is open.
  - Use limit point definition:  $R(v)^c$  is closed  $\iff$  it contains all of its limit points
  - So  $R(v)^c$  does not contain one of its limit points
  - Produces a sequence

$$R(v)^c \supseteq \{(s_n, t_n)\}_{n \in \mathbb{N}} \xrightarrow{n \longrightarrow \infty} (s, t) \in R(v)$$

- The first two conditions defining R(v) are open conditions:
  - The two conditions:

$$\frac{\partial v}{\partial s}(s,t) \neq 0$$
 Condition 1  
 $v(s,t) \neq x^{\pm}(t)$  Condition 2.

– Thus for  $N \gg 1$  we have

$$n \ge N \implies \frac{\partial v}{\partial s}(s_n, t_n) \ne 0, \qquad v(s_n, t_n) \ne x^{\pm}(t)$$

- But  $(s_n, t_n) \notin R(v)$  for such n, so they must fail the last condition: injectivity
  - Third condition:

$$s \neq s' \implies v(s,t) \neq v(s',t)$$

- Failing this conditions means:

$$\forall n > N, \ \exists s'_n \in \mathbb{R} \text{ s.t. } s'_n \neq s_n \quad \text{and} \quad v(s_n, t_n) = v(s'_n, t_n).$$

 $\bullet$  Produces a sequence  $\left\{ s_{n}^{\prime}\right\} _{n\in\mathbb{N}},$  want to show it is bounded.

- Toward a contradiction, suppose not, then there is a subsequence

$$\{s_{n_k}\}_{n_k \in \mathbb{N}} \stackrel{n_k \longrightarrow \infty}{\longrightarrow} \pm \infty.$$

- This implies

$$v(s,t) = \lim_{n_k \to \infty} v(s'_{n_k}, t'_{n_k})$$
 using continuity of  $v$ 

$$= v(\pm \infty, t)$$

$$= x^{\pm}(t).$$

- Why? By definition, precisely we extended v by setting  $v(\pm \infty, t) = x^{\pm}(t)$ .
- But condition 2 for points in R(v) says  $v(s,t) \neq x^{\pm}(t)$ , so this contradicts  $(s,t) \in R(v)$ .
- Sequence is bounded, so apply Bolzano-Weierstrass to extract a convergent subsequence converging to some limit:

$$\left\{s_{n_j}\right\} \stackrel{n_j \longrightarrow \infty}{\longrightarrow} s'.$$

- Use the fact that injectivity failed:

$$\forall n, \ s'_n \neq s_n \quad \text{and} \quad v(s_n, t_n) = v(s'_n, t_n)$$

$$\implies \lim_{n_k \to \infty} v(s_n, t_n) = \lim_{n_k \to \infty} v(s'_n, t'_n).$$

Lemma 8.6.4: For every r > 0 there exists a  $\delta > 0$  such that

$$|t - t_0|, |s - s_0| < \delta \implies \exists s' \in B_r(s_j) \text{ s.t. } v(s, t) = v(s', t).$$

Proof: short.

Lemma 8.6.5: Let  $v_1, v_2$  be two solutions of the CR-equation with  $X_t \equiv 0$  on  $B_{\varepsilon}(0), v_1(0,0) = v_2(0,0)$  such that  $(dv_1)_0, (dv_2)_0 \neq 0$ . Also suppose

$$\forall \varepsilon \; \exists \delta \; \text{s.t.}$$

$$\forall (s,t) \in B_{\delta}(0), \ \exists s' \in \mathbb{R} \begin{cases} (s',t) \in B_{\varepsilon}(0) \\ v_1(s,t) = v_2(s',t) \end{cases}.$$

Then

$$\forall z \in B_{\varepsilon}(0), \quad v_1(s,t) = v_2(s,t).$$

Take perturbed CR equation:

$$\frac{\partial Y}{\partial s} + J_0 \frac{\partial Y}{\partial t} + S \cdot Y = 0.$$

Fix 
$$S \in C^{\infty}(\mathbb{R}^2; \operatorname{End}(\mathbb{R}^{2n}))$$

Lemma (Similarity Principle, used to prove continuation principle and 8.6.8): Let  $Y \in C^{\infty}(B_{\varepsilon}; \mathbb{C}^n)$  be a solution to the perturbed CR equation and let p > 2. Then there exists  $0 < \delta < \varepsilon$  and a map  $A \in W^{1,p}(B_{\delta}, \mathrm{GL}(\mathbb{R}^{2n}))$  and a holomorphic map  $\sigma : B_{\delta} \longrightarrow \mathbb{C}^n$  such that

$$\forall (s,t) \in B_{\delta} \quad Y(s,t) = A(s,t) \ \sigma(s+it) \quad \text{and} \quad J_0 A(s,t) = A(s,t) J_0.$$

Use continuation principle to finish proofs of many old theorems/lemmas.

Theorem (8.6.11, Essential property of  $\bar{\partial}$ ) For every p > 1, the following operator is surjective and Fredholm:

$$\bar{\partial}: W^{1,p}(S^2; \mathbb{C}^n) \longrightarrow L^p(\Lambda^{0,1}T^*S^2 \otimes \mathbb{C}^n).$$

Lead up to the proof of 8.1.5 in Section 8.7

# 1 Goal 2: Continuation Principle

Goal 2: prove a continuation principle:

# Proposition 1.1(8.6.6, Continuation Principle).

On an open  $U \subset \mathbb{R}^2$ , let Y be a solution to the perturbed CR equation

$$\frac{\partial Y}{\partial s} + J_0 \frac{\partial Y}{\partial t} + S \cdot Y = 0$$

where  $J_0$  is the standard complex structure on  $\mathbb{R}^{2n}$  and  $S \in C^{\infty}(\mathbb{R}^2, \operatorname{End}(\mathbb{R}^{2n}))$ . Say that f has an *infinite-order zero* at  $z_0$  iff

$$\forall k \ge 0, \quad \sup_{|z-z_0| \le t} \frac{|f(z)|}{r^k} \stackrel{r \longrightarrow 0}{\longrightarrow} 0.$$

For f smooth, equivalently  $f^{(k)}(z_0) = 0$  for all k.

Then the set

$$C := \Big\{ (s,t) \in U \ \Big| \ Y \text{ has an infinite order zero at } (s,t) \Big\}$$

is clopen. In particular, if U is connected and Y=0 on some nonempty  $V\subset U$ , then  $Y\equiv 0$ .

#### Proposition 1.2(8.1.4,).

Define

$$\mathcal{Z}(x,y,J) := \{(u,H_0+h) | h \in \mathcal{C}_{\varepsilon}^{\infty}(H_0) \text{ and } u \in \mathcal{M}(x,y,J,H) \}.$$

If  $(u, H_0 + h) \in \mathcal{Z}(x, y)$  then the following map admits a continuous right-inverse and is surjective:

$$\Gamma: W^{1,p}\left(\mathbb{R} \times S^1; \mathbb{R}^{2n}\right) \times \mathcal{C}^{\infty}_{\varepsilon}\left(H_0\right) \longrightarrow L^p\left(\mathbb{R} \times S^1; \mathbb{R}^{2n}\right)$$
$$(Y,h) \longmapsto \left(d\mathcal{F}^{H_0+h}\right)_u(Y) + \operatorname{grad}_u h$$

where  $\mathcal{F}^{H_0+h}$  is the Floer operator corresponding to  $H_+h$ .

Used to show (via the implicit function theorem) that  $\mathcal{Z}(x, y, J)$  is a Banach manifold when  $x \neq y$ .
