1 Problem 1

1.1 Part a

We want to show that $\ell^2(\mathbb{N})$ is complete, so let $\{x_n\} \subseteq \ell^2(\mathbb{N})$ be a Cauchy sequence, so $\|x^j - x^k\|_{\ell^2} \to 0$. We want to produce some $\mathbf{x} := \lim_{n \to \infty} x^n$ such that $x \in \ell^2$.

To this end, for each fixed index i, define

$$\mathbf{x}_i := \lim_{n \to \infty} x_i^n.$$

This is well-defined since $\|x^j - x^k\|_{\ell^2} = \sum_i \left| x_i^j - x_i^k \right|^2 \to 0$, and since this is a sum of positive real numbers that approaches zero, each term must approach zero. But then for a fixed i, the sequence $\left| x_i^j - x_i^k \right|^2$ is a Cauchy sequence of real numbers which necessarily converges in $\mathbb{R}$.

We also have $\|\mathbf{x} - x^j\|_{\ell^2} \to 0$ since

$$\|\mathbf{x} - x^j\|_{\ell^2} = \|\lim_{k \to \infty} x^k - x^j\|_{\ell^2} = \lim_{k \to \infty} \|x^k - x^j\|_{\ell^2} \to 0$$

where the limit can be passed through the norm because the map $t \mapsto \|t\|_{\ell^2}$ is continuous. So $x^j \to \mathbf{x}$ in ℓ^2 as well.

It remains to show that $\mathbf{x} \in \ell^2(\mathbb{N})$, i.e. that $\sum_i |\mathbf{x}_i|^2 < \infty$. To this end, we write

$$\|\mathbf{x}\|_{\ell^2} = \|\mathbf{x} - x^j + x^j\|_{\ell^2}$$
$$\leq \|\mathbf{x} - x^j\|_{\ell^2} + \|x^j\|_{\ell^2}$$
$$\to M < \infty,$$

where $\|\mathbf{x}_i - x^j\|_{\ell^2} \to 0$ and the second sum is finite because $x^j \in \ell^2 \iff \|x^j\|_{\ell^2} := M < \infty$. $\quad\square$

1.2 Part b

Let H be a Hilbert space with inner product $\langle \cdot, \ \cdot \rangle$ and induced norm $\|\cdot\|$.

Lemma: For any complex number z, we have

$$\Im(z) = \Re(-iz),$$

and as a corollary, we have

$$\Re(\langle x, \ iy \rangle) = \Re(-i\langle x, \ y \rangle) = \Im(\langle x, \ y \rangle).$$

We can compute the following:

$$\|x + y\|^2 = \|x\|^2 + \|y\|^2 + 2\,\Re\left(\langle x, \ y \rangle\right)$$

$$\|x - y\|^2 = \|x\|^2 + \|y\|^2 - 2\,\Re\left(\langle x, \ y \rangle\right)$$

$$\|x + iy\|^2 = \|x\|^2 + \|y\|^2 + 2\,\Re\left(\langle x, \ iy \rangle\right)$$
$$= \|x\|^2 + \|y\|^2 + \Im(\langle x, \ y \rangle)$$

$$\|x - iy\|^2 = \|x\|^2 + \|y\|^2 - 2\,\Re\left(\langle x, \ iy \rangle\right)$$
$$= \|x\|^2 + \|y\|^2 + \Im(\langle x, \ y \rangle)$$

and summing these all

$$\|x + y\|^2 - \|x - y\|^2 + i\|x + iy\|^2 - i\|x + iy\| = 4\,\Re\left(\langle x, \ y \rangle\right) + 4i\,\Im\left(\langle x, \ y \rangle\right)$$
$$= 4\langle x, \ y \rangle.$$

To conclude that a linear map U is an isometry iff U is unitary, if we assume U is unitary then we can write

$$\|x\|^2 := \langle x, \ x \rangle = \langle Ux, \ Ux \rangle := \|Ux\|^2.$$

Assuming now that U is an isometry, by the polarization identity we can write

$$
\begin{aligned}
\langle Ux,\ Uy \rangle &= \frac{1}{4}\left(\|Ux + Uy\|^2 + \|Ux - Uy\|^2 + i\|Ux + Uy\|^2 - i\|Ux + Uy\|^2 \right) \\
&= \frac{1}{4}\left(\|U(x+y)\|^2 + \|U(x-y)\|^2 + i\|U(x+y)\|^2 - i\|U(x+y)\|^2 \right) \\
&= \frac{1}{4}\left(\|x+y\|^2 + \|x-y\|^2 + i\|x+y\|^2 - i\|x+y\|^2 \right) \\
&= \langle x,\ y \rangle.
\end{aligned}
$$

$\square$

2 Problem 2

Lemma: The map $\langle\, \cdot,\ \cdot\, \rangle : H \times H \to \mathbb{R}$ is continuous.

Proof:

Let $x_n \to x$ and $y_n \to y$, then

$$
\begin{aligned}
|\langle x_n,\ y_n \rangle - \langle x,\ y \rangle| &= |\langle x_n,\ y_n \rangle - \langle x,\ y_n \rangle + \langle x,\ y_n \rangle - \langle x,\ y \rangle| \\
&= |\langle x_n - x,\ y_n \rangle + \langle x,\ y_n - y \rangle| \\
&\leq \|x_n - x\|\|y_n\| + \|x\|\|y_n - y\| \\
&\to 0 \cdot M + C \cdot 0 < \infty,
\end{aligned}
$$

where $\|y_n\| \to M$ since $y_n \to y$ implies that $\|y_n\|$ is bounded.

2.1 Part a:

Using the lemma, letting $\{e_n\}$ be a sequence in $E^\perp$, so $y \in E \implies \langle e_n,\ y \rangle = 0$. Since H is complete, $e_n \to e \in H$; we can show that $e \in E^\perp$ by letting $y \in E$ be arbitrary and computing

$$
\langle e,\ y \rangle = \left\langle \lim_n e_n,\ y \right\rangle = \lim_n \langle e_n,\ y \rangle = \lim_n 0 = 0,
$$

so $e \in E^\perp$.

2.2 Part b:

Let $S := \operatorname{span}_H(E)$; then the smallest closed subspace containing E is $\overline{S}$, the closure of S. We will proceed by showing that $E^{\perp\perp} = \overline{S}$.

$\overline{S} \subseteq E^{\perp\perp}$:

Let $\{x_n\}$ be a sequence in S, so $x_n \to x \in \overline{S}$.

First, each x_n is in $E^{\perp\perp}$, since if we write $x_n = \sum a_i e_i$ where $e_i \in E$, we have

$$y \in E^\perp \implies \langle x_n,\ y \rangle = \left\langle \sum_i a_i e_i,\ y \right\rangle = \sum_i a_i \langle e_i,\ y \rangle = 0 \implies x_n \in (E^\perp)^\perp.$$

It remains to show that $x \in E^{\perp\perp}$, which follows from

$$y \in E^\perp \implies \langle x,\ y \rangle = \left\langle \lim_n x_n,\ y \right\rangle = \lim_n \langle x_n,\ y \rangle = 0 \implies x \in (E^\perp)^\perp,$$

where we've used continuity of the inner product.

$E^{\perp\perp} \subseteq \overline{S}$:

For notation convenience, we'll just write S for $\overline{S}$. Let $x \in E^{\perp\perp}$. Noting that S is closed, we can define P, the operator projecting elements onto S, and write

$$x = Px + (x - Px) \in S \oplus S^\perp$$

But since $\langle x,\ x - Px \rangle = 0$ because $x - Px \in E^\perp$ and $x \in (E^\perp)^\perp$, we can rewrite the first term in this inner product to obtain

$$0 = \langle x,\ x - Px \rangle = \langle Px + (x - Px),\ x - Px \rangle = \langle Px,\ x - Px \rangle + \langle x - Px,\ x - Px \rangle,$$

where we can note that the first term is zero because $Px \in S$ and $x - Px \in S^\perp$, and the second term is $\|x - Px\|^2$.

But this says $\|x - Px\|^2 = 0$, so $x - Px = 0$ and thus $x = Px \in S$, which is what we wanted to show.

3 Problem 3

3.1 Part a

We compute

$$\|e_0\|^2 = \int_0^1 1^2 \ dx = 1$$

$$\|e_1\|^2 = \int_0^1 3(2x-1)^2 = \frac{1}{2}(2x-1)^2 \Big|_0^1 = 1$$

$$\langle e_0,\ e_1 \rangle = \int_0^1 \sqrt{3}(2x-1) \ dx = \frac{\sqrt{3}}{4}(2x-1) \Big|_0^1 = 0.$$

which verifies that this is an orthonormal system.

3.2 Part b

We first note that this system spans the degree 1 polynomials in $L^2([0, 1])$, since we have

$$\begin{bmatrix} 1 & 0 \\ 2\sqrt{3} & \sqrt{3} \end{bmatrix} [1, x]^t = [e_0, e_1]$$

which exhibits a matrix that changes basis from $\{1, x\}$ to $\{e_0, e_1\}$ which is invertible, so both sets span the same subspace.

Thus the closest degree 1 polynomial f to x^3 is given by the projection onto this subspace, and since $\{e_i\}$ is orthonormal this is given by

$$\begin{aligned}
f(x) &= \sum_i \left\langle x^3, \ e_i \right\rangle e_i \\
&= \left\langle x^3, \ 1 \right\rangle 1 + \left\langle x^3, \ \sqrt{3}(2x - 1) \right\rangle \sqrt{3}(2x - 1) \\
&= \int_0^1 x^2 \ dx + \sqrt{3}(2x - 1) \int_0^1 \sqrt{3}x^2 (2x - 1) \ dx \\
&= \frac{1}{3} + \sqrt{3}(2x - 1)\frac{\sqrt{3}}{6} \\
&= x - \frac{1}{6}.
\end{aligned}$$

We can also compute

$$\begin{aligned}
\|f - g\|^2 &= \int_0^1 (x^2 - x + \frac{1}{6})^2 \ dx \\
&= \frac{1}{180} \\
\implies \|f - g\|^2 &= \frac{1}{\sqrt{180}}.
\end{aligned}$$
