Contents

What we're trying to prove:

- 8.1.5: $(d\mathcal{F})_u$ is a Fredholm operator of index $\mu(x) - \mu(y)$.

- Define

$$L : W^{1,p}\left(\mathbf{R} \times S^1; \mathbf{R}^{2n}\right) \longrightarrow L^p\left(\mathbf{R} \times S^1; \mathbf{R}^{2n}\right)$$
$$Y \longmapsto \frac{\partial Y}{\partial s} + J_0 \frac{\partial Y}{\partial t} + S(s,t)Y$$

  where

$$S(s,t) \overset{s \longrightarrow \pm\infty}{\Longrightarrow} S^{\pm}(t)$$

  .

- 8.7: Shows L is Fredholm

- By the end of 8.8: replace L by L_1 with the same *index*

  - *(not the same kernel/cokernel)*

- Compute $\operatorname{Ind} L_1$: explicitly describe $\ker L_1, \operatorname{coker} L_1$.

- Replace in two steps:

  - $L \rightsquigarrow L_0$, modified in a $B_\varepsilon(0)$ in s.
    * Use invariance of index under small perturbations.
  - $L_0 \rightsquigarrow L_1$ by a homotopy, where $S_\lambda : S \rightsquigarrow S(s)$ a diagonal matrix that is a constant matrix *outside* $B_\varepsilon(0)$.
    * Use invariance of index under homotopy.
