### 0.1 Outline

- Prove Theorem 8.5.4
- Prove the continuation principle that was used in Proposition 8.1.4

Outline of statements:

Set up notation:

- $z = s + it$
- $u$ is a solution to an equation (appearing below)
- $X$ is a vector field (time-dependent and periodic) on $\mathbb{R}^{2n}$
- $X, J$ are smooth

- $C(u)$ the set of critical points $u$
- $R(u)$ the set of regular points of $u$

Theorem 8.5.4: $C(u)$ is discrete and $R(u) \hookrightarrow \mathbb{R} \times S^1$ is open and dense.

## 0.2  Proposition 8.1.4

Define

$$\mathcal{Z}(x, y, J) := \{(u, H = H_0 + h) \,|\, h \in \mathcal{C}_\varepsilon^\infty(H_0) \text{ and } u \in \mathcal{M}(x, y, J, H)\}.$$

If $(u, H) \in \mathcal{Z}(x, y)$ then

$$\Gamma : W^{1,p}\left(\mathbf{R} \times S^1; \mathbf{R}^{2n}\right) \times \mathcal{C}_\varepsilon^\infty(H_0) \longrightarrow L^p\left(\mathbf{R} \times S^1; \mathbf{R}^{2n}\right)$$
$$(Y, h) \longmapsto \left(d\mathcal{F}^H\right)_u (Y) + \operatorname{grad}_u h$$

(where $H = H_0 + h$ and $\mathcal{F}^H$ is the corresponding Floer operator) admits a continuous right-inverse (and in particular is surjective).

Proposition 8.6.1 (Transform to CR-equation on R2) If $u$ is a solution to the following equation:

$$\frac{\partial u}{\partial s} + J(t, u)\left(\frac{\partial u}{\partial t} - X(t, u)\right) = 0.$$

Then there exist

- An almost complex structure $J$
- A diffeomorphism $\phi$ on $W$ ?
- A map $v \in C^\infty(\mathbb{R}^2; W)$

satisfying

$$\begin{cases} \dfrac{\partial v}{\partial s} + J\dfrac{\partial v}{\partial t} = 0 \\ v(s, t + 1) = \varphi(v(s, t)) \end{cases}$$

$$(s, t) \in \mathbb{R} \times [0, 1) \implies \begin{cases} C(u) = C(v) & \text{i.e. } u, v \text{ have the same critical points} \\ R(u) = R(v) \end{cases}.$$

Proof: short, include.

Lemma 8.6.2: The set of critical points of $v$ above is discrete. Precisely: There exists a constant $\delta > 0$ such that $(dv)_z \neq 0$ for any $0 << |z| < \delta$.

Proof: Postponed to p.264.

Definition: Multiple points

Proposition 8.6.3: Injectivity result. Let $v$ be a smooth 1-periodic (in $t$) solution of the CR equation, i.e. $v(s, t + 1) = \phi(v(s, t))$ for some smooth $\phi$ ? and $\dfrac{\partial v}{\partial s} \neq 0$. Then $R(v) \hookrightarrow \mathbb{R}^2$ is open and dense.

## 0.3  Regular Points Are Open and Dense

Proof (BIG):

- Show $R(v)$ is open (easy)
- Show $R(v)$ is dense (delicate)

Long proof.

Lemma 8.6.4: For every $r > 0$ there exists a $\delta > 0$ such that

$$|t - t_0|, \ |s - s_0| < \delta \implies \exists s' \in B_r(s_j) \text{ s.t. } v(s,t) = v(s',t).$$

Proof: short.

Lemma 8.6.5: Let $v_1, v_2$ be two solutions of the CR-equation with $X_t \equiv 0$ on $B_\varepsilon(0)$, $v_1(0,0) = v_2(0,0)$ such that $(dv_1)_0, (dv_2)_0 \neq 0$. Also suppose

$$\forall \varepsilon \ \exists \delta \text{ s.t.}$$

$$\forall (s,t) \in B_\delta(0), \ \exists s' \in \mathbb{R} \begin{cases} (s',t) \in B_\varepsilon(0) \\ v_1(s,t) = v_2(s',t) \end{cases}.$$

Then

$$\forall z \in B_\varepsilon(0), \quad v_1(s,t) = v_2(s,t).$$

Take perturbed CR equation:

$$\frac{\partial Y}{\partial s} + J_0 \frac{\partial Y}{\partial t} + S \cdot Y = 0.$$

Fix $S \in C^\infty(\mathbb{R}^2; \mathrm{End}(\mathbb{R}^{2n}))$

Continuation Principle (8.6.6): Let $Y$ be a solution to the perturbed CR equation on an open subset $U \subseteq \mathbb{R}^2$, then the set

$$C := \left\{ (s,t) \in U \ \middle| \ Y \text{ has an infinite order zero at } (s,t) \right\}$$

is clopen. In particular, if $U$ is connected and $Y = 0$ on some nonempty $V \subset U$, then $Y \equiv 0$.

Lemma (Similarity Principle, used to prove continuation principle and 8.6.8): Let $Y \in C^\infty(B_\varepsilon; \mathbb{C}^n)$ be a solution to the perturbed CR equation and let $p > 2$. Then there exists $0 < \delta < \varepsilon$ and a map $A \in W^{1,p}(B_\delta, \mathrm{GL}(\mathbb{R}^{2n}))$ and a holomorphic map $\sigma : B_\delta \longrightarrow \mathbb{C}^n$ such that

$$\forall (s,t) \in B_\delta \quad Y(s,t) = A(s,t) \ \sigma(s + it) \quad \text{and} \quad J_0 A)s,t) = A(s,t) J_0.$$

Use continuation principle to finish proofs of many old theorems/lemmas.

Theorem (8.6.11, Essential property of $\bar{\partial}$) For every $p > 1$, the following operator is surjective and Fredholm:

$$\bar{\partial} : W^{1,p}\left(S^2; \mathbb{C}^n\right) \longrightarrow L^p(\Lambda^{0,1} T^* S^2 \otimes \mathbb{C}^n).$$

Lead up to the proof of 8.1.5 in Section 8.7
